GUTHRIE & CO., LIMITED, Singapore, report [April 1, 1920]: The usual weekly auction, which usually yesterday were marked by a further decline in prices following advances of declines in the London and New York markets. Fine pale crepe sold at up to 9½ cents (one lot realized 92 cents) or 4½ cents lower than last week while ribbed smoked sheet in selling at up to the same figure showed a decline of no less than 9 cents. Two lots sold at 92½ cents, and two lots at 92 cents. The lower grades showed reductions of from 3½ to 11 cents. The quantity cataloged was 1,235 tons, of which 767 tons were offered, but 387 tons only were sold.

The following is the course of values:

	In Singapore, per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked	88½ @ 91½	2/ 3½ @ 2/ 4½
Sheet, good ribbed smoked	80 @ 88	2/ 0 @ 2/ 3
Sheet, fine pale	88 @ 91½	2/ 3½ @ 2/ 4½
Crepe, good pale	80 @ 87½	2/ 1½ @ 2/ 3½
Crepe, fine brown	76½ @ 82	2/ 0 @ 2/ 1½
Crepe, good brown	70 @ 76½	1/ 10½ @ 2/ 0½
Crepe, dark	57½ @ 72	1/ 7 @ 1/ 11½
Crepe, bark	45 @ 57	1/ 3½ @ 1/ 6½

Quoted in Straits Settlements currency; \$1 = \$0.567 United States currency.

ANTWERP RUBBER MARKET.

GRISAR & CO., Antwerp, report [April 23-28, 1920]: The market continues depressed on account of the lack of United States orders. Prices are nominal. About 25 tons of Sumatra plantation crepe A and sheet were sold at 14.50 francs. The stock on hand today is about 674 tons.

The future market opened quiet with falling prices. Today the tone is firmer and prices quoted show a rise of from 0.05 to 0.25 francs on the lowest prices of the week. Dealings amounted to 115,000 kilograms. The price quoted today at closing was 14.10 francs.

The sale of April 28 gave very satisfactory results. Out of 448 tons offered (435 tons Congos and 13 tons Plantation) 390 tons were sold at an average advance of about 0.50 francs for Congos and 0.74 francs for plantation. There was competition for the black sorts and up to 10 francs was paid for 12 tons of black Kassa (tasted 8.90 francs), which means 110 francs above valuations. Prime red Congos were also in good demand and upper Congo Kassa was sold at 8.25 francs.

The principal sales were: Prime Kassa, fine quality, 9 to 10 francs; upper Congo, ordinary red, 8.75 to 9.50 francs; upper Congo, Aruini, 8.50 to 9.75 francs; Kassa Iconda, strips, 5.75 to 6 francs.

AMSTERDAM RUBBER MARKET.

JOOSTEN & JANSSEN, Amsterdam, report [April 30, 1920]:

During the present week business has again been slow, as the influence of the strike, only just finished, is still to be felt. Many of the lots already in port were sold at the beginning of the strike and must now be delivered; as to the parcels not yet sold, owners wish to dispose of same in the inscriptions which will be taken up again at an early date. The sudden rise in the London market had little influence on the Amsterdam being a strengthening of the owners' attitude to ask prices far above the market. The firmer reports from the foreign markets lead to a little turn-over on our terminal market, at slowly rising prices.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THE RUBBER SCRAP SITUATION has gone from bad to worse for the past several months. Both domestic and export business have well-nigh ceased.

The reclaimers have not been in the market owing to the curtailment of their manufacturing operations due to strikes and difficulties of shipment, such as car shortage and freight embargoes.

The downward trend of the crude rubber market has been steadily approaching the low record and has seriously impaired both rubber scrap and reclaimed rubber values which move in close sympathy with crude.

Export trade in rubber scrap has been eliminated by reason of a succession of harbor strikes affecting cartage and loading facilities.

Shoes can be purchased from 7¼ to 7½ cents and standard auto tires from 3¼ to 3½ cents, delivered at mill. The following prices are practically nominal:

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

AMERICAN COTTON. Until the latter part of May, when there was some lively speculation, the market continued steady, prices shifting a few points from day to day around 41.30 cents. April 29 middling upland cotton was 41.35 cents, on May 17 it was 41.00 cents, the lowest point reached in the interval being 41.10 and the highest 41.75. It then shot up, reaching 43 cents on May 20 and 21 and dropping again rapidly to 41 cents on May 22 and 40 cents on May 24, the lowest price reached since March 1; no record of sales on any day of the month.

Planting has been delayed by the weather, rain prevailing in many parts of the South, with a long drought in Texas. It is hampered also by the insufficiency of labor. Yet with late planting a good crop is still possible and no serious shortage is looked for at present. No marked reduction in prices is anticipated for a long time, even if the plan to develop cotton in the British possessions is carried out in earnest, for the supply is not likely to satisfy all the needs.

EGYPTIAN COTTON. After a dull market in Alexandria until the middle of May prices fell rapidly at the end of the third week. English mills would not pay the high prices asked and the American demand fell off, owing in a great degree to the traffic congestion of the railroads. This has compelled automobile manufacturers to suspend construction and lay off their men in some cases, because steel and other materials could not be transported. Consequently the rubber firms cut down production, and the tire builders' pressing need for long staple cotton was eased off. For the new crop, which is late, all the cotton area has been planted, according to some reports, while others say that a part of it has been planted with cereals by government orders. Recent cable advices from Alexandria state that the condition of the growing crop is favorable but the weather has been cool. It is reported that there is about 15 per cent increase in acreage over last season.

Good grade Sakel is worth \$1.35 old crop, \$1.15 new crop. Good grade uppers can be bought for \$0.90 old crop, \$1.05 new crop.

ARIZONA COTTON. Every foot of land available for cotton growing, it is understood, has already been planted, for the growers have last year's experience and profits in mind and know that the Arizona cotton must make up for the loss of Sea Island. The crop has now been practically all sold although there may be 100 to 200 bales still in first hands. This cotton is worth nominally \$1.25. The present season will show a large increase in acreage and with seasonable weather a crop of about 90,000 bales should be raised.

SEA ISLAND COTTON. For practical purposes the crop must be

given up for the present, the boll weevil is spreading into all the Southern cotton fields. Exertions are being made in the West Indies to raise the long staple cotton; even if wholly successful the total production will be inadequate.

COTTON FABRICS. There is no change in the prices of tire fabrics as the spinning and the fabric mills are sold up for the rest of the year. The expectation is that cotton prices will ease off and that it is better to see how the crops promise before buying. Yarn prices are unaltered. The demand for future deliveries in ducks and drills is not so strong as it has been, owing in part to the railroad situation, but the immediate supply is still insufficient. In raincoat fabrics there is little demand as buyers are waiting for the lower prices that are hoped for this summer. The market for sheetings shows signs of weakening here and there but the mills hold firm. Business is very quiet, what buying there is being for rubber concerns and automobile fabric manufacturers.

(Compiled by Davies, Benaglia & Co.)

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

DEMAND for chemicals and compounding ingredients of all kinds naturally diminished during the railroad strike, but the relative scarcity of supplies has been still greater in most lines. Prices in general have remained firm with a tendency to advance. The fact that most large manufacturers of rubber goods have been obliged to curtail operations by 50 per cent has had a marked influence on the demand for supplies.

ANILINE. About the middle of the month the price advanced to 37 cents per pound, but later fell to 34 cents owing to increased supply and reduced demand.

BARYTES. There is practically no spot stock and lack of facilities to deliver has created a very difficult situation for producers as well as consumers.

BENZOL. The supply remains very limited and prices firm.

BLACKS. Prices still remain very high. The demand from the rubber industry has notably slackened temporarily due to reduced tire manufacturing output.

CARBON BISULPHIDE. Spot stocks continue to remain low and the price has advanced to 7 1/2 cents per pound.

CARBON TETRACHLORIDE. The demand during the past month has not been excessive. Spot price remains steady at 13 cents per pound.

DRY COLORS. The leading feature has been the persistent scarcity of supplies for dry color manufacture, which has rendered these products very difficult to secure in volume sufficient to satisfy the demand.

LITHARGE. Prices have held firm notwithstanding a lessened demand by users. Deliveries have been impeded seriously by the railroad strike situation.

LITHOPONE. The demand remains practically double the capacity of production. There has been no change in prices.

SUBLIMED LEAD. The demand has been lessened by the strikes, although it remains in excess of productive capacity. There will be no change in prices until general revision of the lead schedule takes place.

SULPHUR. Prices and demand continue steady.

WHITING. Supplies of English chalk remain at low level, although an increase is expected soon. The output of whiting

is also lessened by the shortage of labor for its manufacture. ZINC OXIDE. Production is said to be increasing and higher prices are possible since there is no slackening of the demand from users.

STRENGTH and RESILIENCY

In Vacuum Dried Rubber

Overheating and oxidation,—a constant danger to rubber when exposed to high temperature and oxygen while drying,—are entirely avoided in "Buflovak" Vacuum Dryers, with the result that Strength and Resiliency are preserved in the highest degree.

The high vacuum and low temperature of "Buflovak" Dryers absolutely prevent overheating and oxidation. Other advantages are economy of time and reduced labor cost.

"Buflovak" Dryers dry all kinds of sheet rubber, reclaimed rubber, rubber compounds, etc.

Profit by the experience of others and let us give you all the facts before deciding on your drying equipment.

No. 4

SUBSCRIPTION: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**SOLID TIRES NOT DOOMED.**

PNEUMATIC TIRES have become so important of late that some are predicting the passing of solid tires.

The success of cord tire construction and the country's sudden need of rapid freight and express transit have created an abnormal situation. The experience gained has been of much value to tire and truck manufacturers, and to the country. It has shown both the possibilities and the limitations of pneumatic truck tires, but does not show that pneumatics will supplant solids. There is need for both, and both will continue and increase.

The threat of the pneumatic has already served to stimulate development in design, compounds, treads and rims, so that the solid tire is steadily growing better. Where speed or the protection of fragile merchandise is the important factor, the giant pneumatic solves the problem, but where very large and heavy loads of goods not readily damaged can travel more slowly the solid tire answers the purpose and gives longer service at lower cost and with less trouble on the road. Tires must be chosen with respect to the service they will be called upon to render.

The pneumatic is ahead in the race at this moment,

but solids and semi-solids are not by any means out of the running.

AMERICAN PLANTATION RUBBER.

VERY LARGE AREAS in the American Southwest will sooner or later be given over to the culture of rubber-producing plants, in the opinion of Dr. Herbert J. Webber, who is recognized as being the foremost plant breeder in the United States. He is also confident that the *Chrysotamnus* could be made to yield 15 or 20 per cent of rubber after improvement through breeding and selection. This, of course, does not mean that *Chrysotamnus* is the best plant for cultivation in the Southwest, but that it is one of the sorts which should be given a trial. In any event, it seems desirable that the rubber investigations being conducted by the botanists of the University of California should be carried through to a definite conclusion.

THE GOODYEAR VULCANIZATION "ACCIDENT."

SO MANY WRITERS describe the discovery of vulcanization in a variety of ways that the true story should be published and emphasized, this for the sake of historical accuracy.

In the first place a "spoonful" of mixture of rubber and sulphur did not accidentally fall on a hot stove, flattened out and become vulcanized. It couldn't. Goodyear's solvent was spirits of turpentine. A mixture, fluid enough to "spoon," falling on a hot stove would bubble, foam and probably burst into flame. At all events the result, spongy, brittle, charred, would not suggest vulcanized rubber.

Nor did a team load of coats on their way from Woburn to Boston catch fire and a charred fragment point the way to the great discovery.

The truth is this: Goodyear was trying to incorporate some sort of dryer in rubber that would permanently prevent rubber clothing from becoming sticky. It was easy to make goods that were free from tackiness for a week or two, but they soon softened and became valueless.

One of his hundreds of experiments was a combination of rubber, sulphur and white lead, dissolved in spirits of turpentine. This was spread with a broad bladed knife on several pieces of cloth. To hasten the evaporation of the solvent he hung the pieces near a stove. One, through accident, rested against the hot iron and turned black, while the others were of a grayish white color. Disgusted at his carelessness Goodyear took the black sample and was about to throw it away when its curious texture halted him. He examined it carefully and recognized what he termed the "change" and which Brockedon later happily termed vulcanization.

This is the story related by men who knew Goodyear, who were rubber men and knew the beginnings of the business. Emory Rider, John Murphy, A. Schlessinger, Henry G. Tyler, Daniel Hayward, J. B. Forsyth, all

pioneers and all in a position to know, in talking with the editor of this journal, agreed as to the main particulars given above.

DANGEROUS DEMANDS OF LABOR.

TO A PROPOSAL made by labor interests for the incorporation in the Illinois State Constitution of an article declaring that the right of labor to organize and conduct collective bargaining should not be abridged, and that courts should be debarred from issuing injunctions in restraint of strikes and to check their promotion. Charles Piez, president and treasurer of the Link-Belt Company of Chicago, and whose valuable service at the head of the United States Emergency Fleet Corporation is well remembered, interposed a forceful objection in speaking for the Illinois Manufacturers' Association recently at the State Constitutional Convention.

The argument was advanced that the sole purpose of a constitution should be to define the principles governing and the guarantees given all the people of a commonwealth, and it can not justly single out any class or group for special favor; nor should any law-making power or tribunal of justice be inhibited from dealing with abuses of which any class or group may be guilty against the common weal, for the interests of the whole state must always transcend those of any class, be they laborers, capitalists, or members of any other group. Answering the claim that labor has been regarded as property rather than an attribute of life, Mr. Piez cited considerable legislation recently enacted, with the aid of employers, to lessen working time, to make mines and factories safer and more sanitary, to set a fair minimum wage, for accident relief, to lighten women's labor, and to check child employment. Nor has any law been passed to deter workmen from associating for any peaceful purpose.

Particularly did Mr. Piez object to the incorporation in the basic law of the state of an article giving organized labor such an unfair and unwarranted advantage over employers as to compel the latter to submit to dealing only with representatives of a trade union instead of with individual employees. To make such a concession, he implied, would be to strike a blow at the foundations of industrial liberty. In return, it would provide no restrictions to safeguard public interests and impose no collective responsibility on labor organizations in carrying out wage or time bargains, just as now practically no redress is afforded an employer whose property is damaged by strikers. If capital is to be held to account, labor cannot escape its obligations while insisting on its rights. The speaker, while freely conceding the privilege of employees to quit work, contented that, at least, the quitters should not be allowed to coerce others "to refrain from work, with a bludgeon, or through the more cruel and effective method of intimidating their wives and children."

The regret is that the sane views of such broad-gage, experienced observers as Mr. Piez are not given wide publicity in the daily press. Indeed, upon the press rests the obligation to discuss these and kindred questions in a generous, judicial spirit, to point out clearly the close interrelation of capital and labor, and, recalling the Æsopian fable of the quarrel of the body and its members, to emphasize how dependent one is on the other, to stress the need of coordination.

Many great newspapers are strangely reluctant about discussing frankly the onerous exactions of some labor unions and their retardation of output, which makes goods scarce and dear. Their silence strengthens the impression that they either fear labor or cater to it for an ulterior purpose. Some are so anxious to win mass circulation that they not only gloss over or ignore the most palpable delinquencies of unionism, but they even stir up class hatred by affecting to defend the most irrational demands of labor; that is, so long as such demands do not affect the interests of those "welfare of the masses" journals.

TRUCK TRAINS AND TIRES.

IN the motor truck road train may be found a solution of the freight transportation problem of the near future. This train consists of one large truck drawing two or more trailers of special design. The trailers are equipped with airbrakes and a steering mechanism assuring perfect tracking, the whole being controlled from the driver's seat. Longer trains can be handled quite as easily.

This method means greatly increased load capacity at the minimum cost of operation in initial investment, fuel consumption, repairs and labor, only one man being required to drive. Such a train has all the mobility, speed and flexibility of operation typical of ordinary truck hauling, and it congests the road less than would three motor trucks operating independently.

Motor truck road trains have been extensively used abroad, but for the most part with iron or solid rubber-tired wheels which have rendered them slow going. The giant cord pneumatic developed in America, however, should add speed to their great carrying capacity and multiply the use of this newest type of rubber tire.

NOT SPECIFICALLY OF THE UNITED STATES BUT OF the whole world, Akron stands as the real "Rubber City." No other city, county, or state in our Union approaches it in rubber factories, number of employees, and product. Only two foreign countries exceed it in production of rubber goods.

The last census shows that with a population of 208,435 persons, an increase of 139,368 during the last decade, Akron's rate of growth has been 201.8 per cent. Due chiefly to the remarkable expansion of its rubber business it now ranks next to St. Paul, Minnesota, in the list of great American cities.

A Modern Tire Plant Layout.

By M. J. Parson¹

IN PLANNING a modern tire factory there are many problems to be considered that involve the best engineering practice combined with practical knowledge of tire building. There is also a great difference of opinion on important points as to the method of manufacture and also the lay-out of a modern tire factory.

Large modern plants have three to six-story building units and, to accommodate their phenomenal growth of the past few years, changes in the location of departments have been frequent. One of the first companies to manufacture pneumatic tires is now erecting a large plant at Buffalo on the one floor plan. This method, of course, is very practical but a considerable area of land is required to build a plant on this plan for large production. A smaller plant will produce much better results in a building about 80 feet wide, 280 to 300 feet long and two to three stories high. If the machines required for the manufacture of pneumatic tires and tubes are laid out properly the maximum production can be reached and there will be very little lost motion throughout the entire plant. A material saving can be effected, moreover, by the use of gravity.

LOCATION.

The plant should be located close to ample water supply and economical electric current should be available. The water should be analyzed to discover if it has any undesirable properties. It is also desirable to locate the plant near the railroad, so that a siding can be obtained as well as advertising to the traveling public.

In many instances an ample water supply is not available when all other points that have to be considered in the location, such as transportation facilities, etc., are met with. In such cases there can be installed what is known as a spray or cooling pond, connected to the city mains and the water cooled and used over again.

POWER, HEAT, AND LIGHT.

It is generally found to be more economical to buy electric power, the higher voltages being stepped down by transformers which should be placed in a fire-proof building. Alternating current is satisfactory for all purposes except calenders where two-voltage direct current is necessary to give a 4 to 1 speed range. The same applies to tubing machines for which variable speeds are preferable, where direct drives are applied.

To secure this direct current a motor generator set or rotary converter is necessary. The rotary converter is more economical and efficient but more difficult to repair under ordinary conditions.

Other power house equipment includes boilers of sufficient capacity to supply steam for heater presses, vulcanizers, mills, calenders, dryers, pumps and heating.

The lighting required is a good industrial lighting unit with the exception of around the calenders, where a special unit is

required so that there will be sufficient light both in front and back of the calenders. The lighting unit for the plant as outlined is one light to a bay, the bays being 20 feet square.

FIRST FLOOR. WASHING ROOM.

For a daily production of 450 tires using 25 per cent of wild rubber, two 16 by 36-inch cracker-washers can wash the rubber in six hours. The initial washer installation should consist of one 16 by 36-inch machine with a 75-h.-p. drive suitable for a future cracker-washer of the same size. A soaking vat, cutting machine, and drying apparatus will complete the washing room equipment.

MILL AND CALENDER ROOM.

The mill line should consist of a unit of three 22 and 20 by

30-inch mills with a 250-h.-p. drive. Mill No. 1 to be used for breaking down and mixing. Mill No. 2 for mixing and mill No. 3 for mixing and warming up the calender stock. A mixer located next to the mill unit can be used to advantage in preparing rubber for the mills.

The calender should be not less than a 24 by 66-inch 3-roll machine with a 100-h.-p. drive. The delivery speed ranges from 10 to 40 yards per minute for which a

100-h.-p. direct current, two-voltage variable-speed motor is used. Additional equipment includes fabric dryer, tube machines for beads and treads, cooling tables, stock bins, sifting machines, etc. Endless cable bead wire has met with almost universal success and can be purchased in the various sizes. A machine has been developed that should be installed for insulating the bead wire.

The fabric dryer is a three-roll reversible machine operated from one side and requires very little floor space. This should be located at the rear of the calender. One 3-inch tubing machine with a 7½-h.-p. alternating-current motor drive easily cares for all bead requirements. A 6-inch tubing machine will provide enough treads for all sizes up to and including 6-inch. A 25-h. p. variable-speed direct-current motor is used.

HYDRAULIC PLANT.

The accumulators, pumps and air compressors are located in the main building adjacent to the heater presses.

SPREADER BUILDING.

The spreading or impregnating of fabric must be done in an absolutely fire-proof building. The cement-mixing room must also be separated from the spreader room by a fire wall. Equipment for this department should include churns and impregnating machines.

SECOND FLOOR.

The second floor is devoted entirely to building, curing, and finishing casings. The necessary equipment will include one bias-cutting machine, heater presses, tire-building stands, cores, molds, tables, etc.

(Designed by E. Raymond Threlby.)

PERSPECTIVE VIEW OF A MODERN TIRE PLANT.

¹Engineer in charge of eastern and export sales for the Allen Machine Co., Erie, Pennsylvania.

MOLD AND CORE EQUIPMENT.

This equipment is of great importance. In designing a non-skid tread considerable expense can be saved by using a design which will eliminate, as far as possible, all hand work in connection with the manufacture of the mold. This can often be done without affecting the qualities of the non-skid design. Collapsible cores are used, and as air bags are necessary for curing cord tires a complete mold equipment for their manufacture should be installed. Additional equipment will include base rings for molds, head placing rings and bead molds.

EMERGENCY ROOM.

The emergency or hospital room is located on this floor, adjacent to the elevator. While the more serious accidents occur in the mill and calender room on the main floor, minor accidents are more frequent on the second and third floors. This room should be sanitary, and in fact a miniature hospital completely equipped and managed by a competent physician.

THIRD FLOOR.

The third floor is devoted entirely to tubes. The tube vulcanizer should be equipped with extra inside carriages and transfer carriages to secure full production. Wrapping and stripping lathes, skiving machines, nut tighteners, flap machines and deflating machines are all necessary equipment. Building tables and splicing equipment, where the acid cure is used, can be built at the plant.

The plant here outlined provides for an initial capacity of 500 casings and tubes per day and is designed for an ultimate capacity of 2000 tires a day without any material changes in the building. Additional equipment and three shifts will be necessary to reach this production.

Below are outlined the various operations from the receiving to the shipping room, showing the machinery, connections and small tools required for each operation, and followed by pertinent remarks.

Operation.	Machinery.	Connections.	Small Tools.	Remarks.
Receiving room.	1 dormant scale, 1,000 pounds capacity.	Saw, hatchet, hammer, cold chisel, hand hobs, crow bars, hand trucks.	The scale is required to weigh all material received by the factory.
Inspection table.	All material received should be inspected before entering the factory.
Compound room.	Fairly large room. Uniform temperature should be kept at all times.
Rubber storage.	Located in the basement. Should be cool and protected from the sun.
General fabric storage.	An inspecting machine should be installed which would also measure fabric so that claims could be made in case of shortages.
Fabric drying.	3-roll reversible fabric dryer.	Steam.
Cement and spreader.	Battery of three 200-gallon churns and 16-foot spreader or impregnating machine with double coil.	Gas can, cement cans, scoop pans, knife, scissors, castor-truck	This should be in a separate building, absolutely fireproof, divided by fire-wall. The equipment should not be direct-drive type on account of the fire hazard. A motor is located in a small pent house to operate both churns and spreader by belt drive.
Gas storage.	1,000-gallon tank, also pump.	Gas cans, funnels.
Vat.	Poured concrete, waterproofed, made in any desirable shape.	Steam and water.	For soaking rubber.
Weighing.	Portable platform scales.
Cracker and washer.	Two 16 by 36-inch cracker-washers direct 75-h.p. drive.	Steam and water.	This operation is very important as it is imperative that certain grades of rubber should be sheeted as finely as possible to eliminate all foreign matters.
Small storage.	Rubber is stored and placed on racks before going to the drying room.
Drying.	Dry kiln.	Steam and water.	Baskets and wheel truck.
Sifting.	Sifters.	Compound pans.	Sifting pigments is a very important operation. It is also desirable to dry pigments especially when received in bags instead of barrels. Some pigments collect moisture rapidly.
Weighing.	Three table scales.
Compounding.	Long table racks.	Wheel trucks, knives, scissors, compound pans, small pans.
Mixing.	Mixer (enclosed)	Steam and water.	Wheel truck and compound pans.
Milling and warming.	1 unit of three 22 by 20 by 60-inch mills direct 250-h.p. drive.	Steam and water.	Mill knives, butcher knives.	Mill No. 1 to be used for breaking down and mixing. Mill No. 2 for mixing and mill No. 3 for mixing and warming up stock for calender.
Frictioning, etc.	1—24 by 66-inch, 3-roll calender, 100-h.p. direct drive. The delivery speed ranges from 10 to 40 yards per minute.	Steam and water.	Knives, scissors, 2 hand trucks with cradles, 2 cradle trucks
Weighing.	Portable platform scales.
Cutting and slitting.	Cutting and slitting machine, direct 5-h.p. drive.	Knives, scissors, truck.	The machine is used for cutting stock for tubes, side walls, cushions, etc., for tires.
Weighing.	Portable scale.
Fabric cutting.	Bias cutter, cutting tables, stock racks, liner cleaners, liner wind-up.	Books, liners, knives, stitchers, scissors, etc.
Rubber preparation.	Tables.
Tread making.	6-inch tuber, 25-h.p. direct drive.	Water and steam.	Books, scrap boxes, scrap truck
Insulating.	Cold press with hot platen.	Water and steam.
Bead making.	3-inch direct-drive tubing machine.	Gas, water and steam.
Bead making.	Bead machine, stand for bead reels, table, bead-covering device.	Scissors, knives, rack for reels.
Bead storage.	Bead drums, racks.
Tire building.	Building stands, cores, stock racks, stripping table, tool boxes, stand for finished tires. Four jacks.	Rollers, stitchers, knives, scissors, etc. Gas cans, cement cans, wrenches, hammer, scrap boxes, core racks, base rings, racks, wheel truck.
Vulcanizing.	Heater presses, 2 accumulators, temperature controller stand for molds, overhead trolley.	Air, steam, and water.	Wrenches, cracking bars, stripping bars, soapstone can, brushes, etc., molds, rings, etc.
Finishing tires.	Buffing, painting, wrapping, trimming.	Air.	Swabs, brushes, knives, hand trucks, scissors, etc.

Operation.	Machinery.	Connections.	Small Tools.	Remarks.
Tire and tube storage.	Storage racks, scales.	This room is located on the second floor directly above the shipping room. All windows are painted a dark color so that a cool, uniform temperature may be maintained at all times.
Tube making	Poles, stock racks, pole storage, cross stands, making tables, pad table.	Die for cutting pads, knives, scissors, rollers, stitchers.
Cross wrapping	Wrapping machine, 3-h.p. direct drive.
Tube curing.	Horizontal vulcanizer, temperature controller.	Steam, air, and water.
Tube stripping.	Stripping lathe.	Air
Tube buffing.	1 skiving machine, valve on set, nut tighteners direct drive, fractional h.p. required.	Gage for pant
Tube splicing	Splicing mandrels, splicing stands.	Air	Avial cans, brushes, etc.
Tube stripping.	Portable racks.
Inspecting.	Tank.	Water and air.
Deflating.	Deflating machine, vacuum pump.
Wrapping.	Table.	Tube wrapping for shipping.
Flap making.	Flap machine, flap molds, tables.	Jack, scissors, knives, dies, etc.
Rag rolling.	Rag roller, direct 1-h.p. drive.	Water	Wools in conjunction with stripping lathes.
General stock room, 2nd floor.	Racks, bins, tables, scales.

PROGRESS OF FABRIC.

As soon as the fabric is received it should be inspected and tested to see if it meets with specifications. After inspection the fabric is placed in general storage; from thence it is taken to the fabric dryer to eliminate all moisture. After the drying operation the cord fabric should be weighed before sending to the

trouble. Constantly improving methods of handling plantation rubber may possibly in the future eliminate the washing operation.

When the rubber has been broken down and finally sheeted, it is placed in storage until it is ready for the dryer. From the dryer it goes to the scales—and from there to the compound

INTERIOR VIEWS IN A MODERN TIRE AND TUBE PLANT.

spreading room and it should also be weighed after the spreading operation. The fabric is taken from the fabric dryer to the calender, and impregnated fabric is also sent direct from the spreading room to the calenders. After the calender operation the fabric is sent to the cutting and slitting machines to be cut into proper sizes for building of tires.

ROUTING OF RUBBER.

The rubber after being inspected and weighed is stored in the basement, which provides a cool, dry place. As needed it is taken to the washing room. It is not the practice of some manufacturers to wash plantation rubber, as they claim that washing and subsequent drying weakens the rubber. However, if it is not thoroughly washed there is the chance that some foreign matter or fermentation will remain in the rubber, eventually causing

room, where it is apportioned to the various compounds and sent to the mixer or breaking down and mixing mills. From mixing and warming mills the stock is sent to the calenders and to the tube machines. From the calenders the sheeted stock is delivered to the slitting machines for preparation for tubes while the frictioned fabric goes to the slitting machines and cutting tables.

IN CONCLUSION.

From the above it will be noted that the first operation starts in the basement of the building and the final operation ends there. This department is used for both receiving and shipping. It will also be noted that the majority of the operations are performed on the first floor and located in the most suitable place to allow for expansion at any time, that is, installing additional mill lines, calenders, etc.

It will also be noted that all materials move in one direction on the first floor and on the second and third floors they move in the opposite direction so that the finished materials will arrive directly above the shipping and receiving room. An elevator and chute are located at this end so that all materials can be easily handled.

The repair and maintenance department is located in the basement. A laboratory for testing and experimenting is almost a necessity and can be located on the second floor or adjacent to the factory superintendent's office.

Equipment for these two departments will vary depending on the amount of work of this character that it is desirable to accomplish in the initial unit.

MORE ABOUT JAR RINGS AND POISONED OLIVES.

THE article on jar rings and poisoned olives that was published in THE INDIA RUBBER WORLD, May 1, 1920, elicited the following comments from prominent manufacturers of rubber jar rings.

BOSTON WOVEN ROSE & RUBBER CO.

The Bureau of Chemistry of the Department of Agriculture authorizes the statement that it has met with a gratifying degree of cooperation on the part of packers of jar rings in improving methods to such an extent that danger from botulinus poisoning in future packs will be eliminated. Five groups of deaths traced to poison produced by the organism known as bacillus botulinus have occurred in New York City, Detroit, Michigan, Canton, Ohio, Memphis, Tennessee, and Kalispell, Montana. All of these cases were due to the consumption of ripe olives. No fatalities have been traced to green olives.

Very extensive investigations have been made by scientists from the Bureau of Chemistry with the cooperation of the packers and the packers also have employed specialists to study the causes of botulinus poisoning and the precautions which should be employed to prevent further difficulty. The experts agree that the trouble is not inherent in the type of container used. Whether the olives be packed in glass jars or in tin cans, they may be rendered absolutely safe if proper precautions are taken to prevent the infection with bacteria during handling and if the packages when filled are sterilized at a sufficient temperature and for a sufficient period of time. It is entirely practicable, say the specialists, to sterilize both glass containers and tin cans at a temperature high enough to insure absolute sterilization.

Unfortunately some packs of ripe olives put up in glass as well as some in tin during past seasons were not prepared with all the precautions now known to be essential and were not sterilized at a sufficiently high temperature and some of these goods in glass were responsible for the fatalities. It is probable that of all the ripe olives on the market but an extremely small number actually contained botulinus. Of more than 2,000 individual packages collected and examined in the Bureau of Chemistry but eight were found to contain botulinus, and seven of these were from the output of one manufacturer and from one batch of his output. In addition to these eight, the bureau has examined samples of some of the olives responsible for the fatalities and has also found botulinus in these specimens.

Since there is a possibility of danger from any ripe olive which has been insufficiently sterilized the Bureau of Chemistry has suggested to the industry that all ripe olives in glass or in tin wherever located be carefully inspected and that any which show the slightest degree of decomposition be destroyed. It has further suggested that all ripe olives which have not been processed at a sufficiently high temperature be returned to the packers for immediate reprocessing at a sufficient temperature to insure complete sterilization.

With few exceptions the olive packers have most heartily fallen in with all suggestions made in the interest of the public safety and by mutual agreement entered into by practically all of the packers they are now taking steps to withdraw from the market all ripe olives in glass containers which have not been sterilized at a sufficient temperature. Similar steps are being taken by some of the packers in the case of minced olive relishes in view of the fact that one death due to the consumption of such a product has been reported.

While concerted action to remove ripe olives packed in tin and processed at a low temperature has not been taken by the packers, the fact that spoilage in tin has so consistently resulted in making a "swell" out of the can constitutes a warning to the purchaser which is not often disregarded. There is no reason to anticipate danger from properly packed and processed ripe olives, whether they be packed in tin or glass containers.

THE MANHATTAN RUBBER MANUFACTURING CO.

In an article that appeared in the "Literary Digest" of May 1, it was claimed that ripe olive poisoning was an infection from the botulinus germ present in the rubber rings used on the glass jars.

While we are not an authority on germs and would not recognize the botulinus if we met him face to face, we do feel that we are perfectly competent to refute the statement that this or any other germ can exist in a rubber jar ring. If rubber goods are subject to infection, and we certainly do not believe they are, it is high time that we took a trip around to the various hospitals and insisted upon their giving up the use of surgical rubber gloves, rubber tubing, sheeting, and many other rubber articles which they use; and where is there any line of work in which more care is needed for cleanliness and sterilization than in a hospital? In fact, life often depends upon the sterility of a piece of rubber goods.

In the manufacture of a rubber jar ring there is about as much chance for the germ to exist as there is for the proverbial snowball. The rubber which is used in jar rings is first very carefully washed with hot water to free it from all foreign particles. It is then mixed with chemically pure materials, one of them being sulphur. The sulphur, itself a very good disinfectant, is present in all rubber goods, and acts as an excellent germicidal agent. A careful examination of a piece of rubber goods will reveal a grayish substance that completely covers the surface of the article. Sometimes this condition is more noticeable than at others, but it is always present. It is caused by an efflorescence of sulphur and is known in the rubber trade as "bloom." This covering of sulphur serves as a very efficient protection against any germs. During the process of manufacture, the rings must go through a heating process in live steam for about two hours at about 290 degrees F. Therefore, it would be rather a hardy germ that would be able to live through such a process as this. In fact, we doubt if the germ has been discovered that would stand this particular treatment. The rings are then packed in sanitary and carefully sealed boxes, and are ready for the consumer. To our mind it is absurd that any germ, even the botulinus, could exist in a rubber jar ring after it has been through the regular manufacturing process.

A RUBBER COLD-WATER BOTTLE.

One of the manufacturers of rubber goods recommends filling its "Black Beauty" hot-water bottle with cold water for use in keeping cool in summer. This bottle has the special "C-Kure-Neck," described in THE INDIA RUBBER WORLD, March 1, 1918. (The Miller Rubber Co., Akron, Ohio.)

Tire Fabric and Long-Staple Cotton.

By L. W. Alvey-Schmidt, Consulting Economist.

IT HAS BEEN ESTIMATED that 50,000,000 tires will be required during the present year and that 60,000,000 at least will be needed to cover the requirements of 1921. On the basis of this consumption the American tire industry will need approximately 315,000,000 pounds of tire fabric, which to produce will consume nearly 400,000,000 pounds of cotton. Experts say that the available supply of long-staple cotton will hardly be sufficient to cover this year's demand and will fall 70,000,000 pounds behind requirements during the coming year. Who will doubt, then, that the fabric situation is to-day one of the most important problems of the automobile tire industry?

It seems paradoxical that such a situation should occur in the United States, the largest cotton-producing country of the world. But the fact cannot be denied, and at the present time no other remedy can be found than to acquire as much of the foreign long-staple cotton as may be induced to come to our market. The boll weevil and the indolence of our cotton growers are both to be blamed for this situation. Having had a practical monopoly for many years in the production of the best long-staple cotton, so absolutely essential to the manufacture of many cotton fabrics, our cotton growers have permitted not only this monopoly to pass from their hands but have also looked on while the pest destroyed what was left of the former possessions. To-day the Sea Island production is practically negligible and the American tire industry is dependent upon foreign producers for one of its most important raw materials. Of the best Sea Island quality there is not enough produced to go around, and the fact that approximately half of it is grown in our own market is immaterial. Of the lower grades of Sea Island and the best Egyptian product less than 10 per cent are produced in the United States, while England controls 89 per cent of it by way of the British Empire and the occupation of Egypt. Moreover, 70 per cent of the lower grades, comprising Egyptian, American, and the Peruvian group of long-staple cottons, is produced inside the British Empire. Of course, steps have already been taken to remedy the situation, but the excellent results obtained so far in various sections of the United States cannot satisfy the increasing demand for the product coming from the American tire industry and other industries that are buyers of this grade of cotton.

The wave of high prices, produced by the war, is now well past its crest and the chances are that prices will decline. The break having started in one part of the market will soon spread to other branches of the industry and it is difficult to see how the tire industry can keep up prices if reductions in many other fields become necessary. Experience has shown that, whenever there is a general decline in prices, a downward movement independent of the cost of production usually follows, resulting in financial loss to those factories who are caught napping. Two alternatives are left to an industry in such a situation. One is to get out of business and the other is to increase the supply of the raw material, which in this instance is long-staple cotton.

LOCATION OF VISIBLE SUPPLIES.

There is no doubt that the latter way will recommend itself most favorably to our tire manufacturers. It is the only alternative that will make possible the continuation of business and avoid an all around reduction in the fabric specifications of the American automobile tire. But the possibilities of adding to the existing resources of long-staple are only in part within the reach of our cotton consumers. Of the available supply of 1921, estimated to be 330,000,000 pounds, approximately only one-quarter is expected to consist of American cotton. Practically all the

rest, excluding small quantities located in Peru, is to come from Egypt.

The determination of the price of the article, therefore, does not lie in American hands. The market point of gravity has changed to England and it is England also that will make the price. No doubt England does not intend to put undue pressure upon the American tire manufacturer in search of long-staple cotton, but the situation is one that deserves the closest attention of all who are interested in the production of tire fabrics and the making of tires.

Long-staple cotton, as represented by Sea Island and Egyptian, is a variety distinct from other grades and qualities. It thrives in certain regions of the world where conditions are especially suitable for its propagation. But it seems to have its real home in the Sea Islands. Only the climate and soil of these islands produces from year to year that fine quality and length of staple that is the characteristic of this cotton. In all other countries where it has been introduced with the aid of seed brought from the Sea Islands, it shows a tendency to deteriorate, and must be improved by occasionally introducing new seed. The best staple is produced in the British West Indies. A somewhat inferior quality is grown in Florida, Georgia, and, during recent years, in Arizona. Some of it is grown in the West Indies, but to-day the bulk of the supply finds its origin in Egypt. That country also produces by far the largest quantity of long-staple cotton in the world and, together with its large output of Sea Island, dominates the long-staple cotton situation. In fact the predominance of Egypt in this respect has been felt to be a distinct disadvantage to international cotton trading, as it makes the world's cotton industry dependent on one market for nearly three-quarters of its total requirements of long-staple cotton. The small production of long-staple cotton in the United States or that of Peru cannot really be sufficient to relieve any shortage that would be caused by a sudden breakdown in the Egyptian supplies.

LIMITATION OF EGYPTIAN COTTON SUPPLIES.

Such a breakdown, however, is by no means an utter impossibility. If proof were required for this contention, it is supplied by the recent report of the British Empire Cotton Growing Committee that has made a very intimate study of the conditions of cotton production in the British Empire with the avowed purpose of making the Empire independent of foreign cotton supplies. Egypt comes in for a great deal of appreciation. The report points out the possibility, now unfortunately nearly accomplished fact, of the likely destruction of the Georgia and Florida Sea Island cotton crops and deducts from this the great importance of Egyptian cotton for the future needs of the Empire. American spinners that consume long-staple cotton have similarly hoped to secure supplies from this source and it is therefore important to state that the Egyptian resources are not at all unlimited, in fact they have already reached a point where little additional production may be expected. Although Egypt appears to be a very large country on the map, its cultivated area is comparatively small, as it is closely narrowed in on both sides by the desert. All in all, 12,000 square miles can be cultivated and it would be utterly impossible to plant all of it with cotton. In fact the great stress laid upon cotton production in Egypt forms to-day a distinct danger to the economic balance of the country which is exposed to very severe risks whenever the crop does not come up to expectations. Also the best cotton, that of the Sea Island variety, grows only in the so-called Nile delta, where the total cultivated area does not exceed 3,100,000

acres. Throughout the whole cotton territory of Egypt cultivation can be carried on only by the aid of irrigation. This has certain definite disadvantages which are not always connected with irrigation in other parts of the world. If the Nile is low or falls early in the autumn, the period of water scarcity begins early the next spring, and if this is followed by a late Nile, the period of scarcity is still more prolonged during the next summer. So even with the protection of the Nile water, scarcity may arise. But in addition, there is also the danger of an oversupply of water, an example of which was given during the year 1908 when one-third of the cotton crop was ruined owing to over watering. Therefore, to make the water supply of Egypt not only permanent but also safe for the consumer, it will become necessary to execute vast schemes of storage and irrigation of which only a beginning is made.

All irrigation is expensive and increases the cost of production. The cost of adding to Egypt's irrigation facilities may be very high and the cotton of that country must feel the effect. The Cotton Growing Committee proposes to open by irrigation a large part of the available land in the delta which would permit the production of an additional 800,000 bales of cotton. The cost of this enterprise is estimated at \$180,000,000 or, as the report says, the value of one year's crop at present prices. The addition to the supply might be well worth the expense, but the plan cannot be completed before 20 years at least. So, whatever may be the outlook for our old age, the present does not seem to be materially improved. Finally, Egyptian cotton is attacked just as readily by insect pests as that in the United States. The Egyptian cotton has an enemy of its own, the seed boll worm. It appeared, providentially for its own propagation, during the year 1913, and has not been fought very energetically by the British authorities in view of the more important battles on hand by the summer of 1914. The result is that notwithstanding irrigation, the Egyptian cotton crop is smaller to-day than in former years, a fact that will affect very seriously the tire industry of the world.

ENGLISH TIRE INDUSTRY WILL HAVE FIRST CALL UPON EGYPTIAN COTTON.

The English have a tire industry of their own. If Egyptian cotton should run below the requirements of that industry there is just a possibility that England will provide first for the needs of her own manufacturers and let the others shift for themselves. It is open to England to protect her cotton resources against the foreign consumer by various means without interfering seriously with the general organization of the Empire. An example of what might be done is the recent act of the Indian Council levying an export duty of 15 per cent upon the export of certain classes of Indian hides if exported to points outside the British Empire. With the world running short of long-staple cotton and Egypt being the only source of supply, some similar expedient may suggest itself to the Egyptian Government, and no other source would be left to our tire manufacturers outside our own small production and the not very plentiful supply of Peruvian cotton.

No doubt this situation cannot be permitted to exist for any length of time, and especially when it is considered that all the india rubber consumed by the United States tire industry is also supplied from outside the United States. What such a dependence of an industry upon foreign sources of raw material may mean to any country has been illustrated most recently in the case of our own rubber industry when a special arrangement had to be made with England for the supply of rubber in the early days of the war, and still more by Germany, where whole industries were destroyed from the same cause.

The American tire industry can correct the cotton situation only by aiding in increasing the supply. As the United States is a cotton-producing country and able to produce a long-staple

cotton that serves all the purposes of the tire fabric industry, there is no reason why greater efforts toward adding to its supply should not be made at home. The present need is real and it does not permit much further delay. There is an apparent shortage of 70,000,000 pounds in our own industry alone, and the whole tire-producing world is out for whatever can be had of the material. The present shortage will be felt just as severely in Europe. Unfortunately for the consumer, it does not affect the raw material alone but also extends to the industrial equipment.

MORE SPINNING AND WEAVING FACILITIES REQUIRED.

The demand has outgrown the facilities for handling the production. Even if our cotton growers could be prevailed upon to increase the acreage of long-staple cotton and add the required 70,000,000 pounds, it is still doubtful whether we could hold in readiness the spindles and looms necessary for the manufacture of the fabrics. This is a feature of the situation that must not be left unattended. There are sufficient examples in our own economic history where groups of producers were induced to increase their production only to find that the added quantities could not be made ready for the market. Prices declined as the result of such an occurrence and the producer lost confidence in his advisers. The following year less of the product was made available by the farmers than in the years preceding the increase. The same might happen to our cotton growers. Therefore let more equipment be ready in time. Getting additional industrial equipment is more difficult to-day than increasing agricultural production. The main difficulty in the way of accomplishing this is that the tire makers will not be able to pay much higher prices or even the present ones for fabrics in the future. What, then, will be the inducement for the cotton fabric producers to add to the output? Opinions differ as to whether the price of long-staple cotton will be the only factor likely to bring about the desired adjustment of demand and supply.

The production of long-staple cotton offers to the planter a special inducement because, when once firmly established, it brings a better result for the labor and cost expended upon its production than any lower-grade cotton. There will always be planters ready to make a special effort in favor of the better-priced product and if our tire makers are willing to offer to those producers a steady market they will probably find enough cotton forthcoming for their purpose. Such a development, however, cannot be expected to take place inside a year or two. It may take three or even four years before the farmers have caught up with their opportunity and in the meantime the rapidly growing automobile industry may have enormously increased the demand for tires.

TRADE RECIPROCITY SUGGESTED.

In the meantime foreign long-staple cotton must be induced to come to us, and owing to the foreign exchange situation we are fortunately able to pay a comparatively good price for imported cotton without greatly increasing our own expense. Provided, therefore, our fabric makers do find an open market they should be able to secure foreign long-staple cotton, Egyptian or other, at rates commensurate with the existing selling prices for fabrics.

There is, however, another aspect to the present situation. Long-staple cotton for tire fabrics being a product that, at the present time at least, must be imported in limited quantities equal to the consumption, deserves the special protection of those in charge of the foreign trading activities of the nation. The sources from which this cotton can be obtained must be held open to all who require it. Free access to the raw materials of the world has been proclaimed as one of the reasons why the American nation joined the war. It is now to be seen that this right is not taken away from us and that we should be able to buy our long-staple cotton wherever we please, under conditions very much the same as those applying to our foreign competitors.

Electric Drive in a Tire and Tube Plant.

By H. F. Barton¹

ADDING A NEW INDUSTRY to an already diversified group in the city from which it derives its name, the Syracuse Rubber Company affords an excellent example of a young, vigorous and rapidly growing organization. The product consists of cord tires and automobile tubes bearing the trade name of Syra-Cord. Organized in July, 1919, incorporated under the laws of the state of New York with a capitalization of \$3,000,000, the company is the only manufacturer of rubber tires and tubes in central New York.

The plant is situated at East Syracuse, a suburb, on the main line of the New York Central Railroad and the electric lines of the New York State Railways. Here the company owns thirty-eight acres of desirable land that will permit the expansion which the present business of the company indicates will be necessary.

Approximately three hundred people are employed at the present time on an eight-hour shift, though it is anticipated that eventually three eight-hour shifts will be employed. The ultimate capacity of the present plant will be approximately twelve hundred casings and three thousand tubes a day based on three eight-hour shifts.

The present plant, known as Unit No. 1, is a three-story structure of brick, steel and concrete, with an effective working space of twelve thousand square feet on each floor, which is exclusive of hallways, elevator shafts, etc. The design and construction of the building is such as to insure the most efficient handling of all material and any duplication of operations is eliminated. The raw material is unloaded from the cars to the platform thence to the warehouse on the first floor. From here it goes through the washing process, the various mixers, mills and calenders and then to the second floor where the tires are built up.

In line with other progressive and up-to-date methods which this company follows, it adopted electricity as the motive power for driving all of the machines in the plant. Also, appreciating the advantages of purchasing power, electric current is bought from a local company which distributes electric energy transmitted from Niagara Falls, a distance of one hundred and fifty miles.

Alternating current is delivered by the lighting company at twenty-five cycles, three-phase, 11,000 volts to its own outdoor substation. Here the voltage is stepped down by means of three 250-kva. Westinghouse oil-insulated self-cooled transformers to 2,300 volts, the potential required by the larger alternating-current motors used in the mill. The smaller alternating-current motors are supplied through a bank of three 37½-kva. transformers that step down from 2,300 to 440 volts, the voltage for which the motors are wound.

As the calenders have a wide range of speed, direct-current motors are a much more satisfactory form of drive, and this kind of current is obtained from a Westinghouse motor-generator, consisting of a 2,300-volt synchronous - motor direct connected to a 200-kw., 115/230-volt direct - current three-wire generator. This double voltage permits the obtaining of the desired speed range on the motor - driven calender, the lower speeds being obtained on 115 volts and the higher speeds on 230 volts.

A 66-inch calender is connected through a herringbone reduction gear to a 100-h-p. variable-speed direct-current motor that is controlled by an automatic double voltage calender controller providing dynamic braking and operated by a drum type master controller. Safety rods are placed on either side of the calender.

The warming mill, mixing mill and washing mill are each driven by individual Westinghouse alternating-current motors equipped with controllers and solenoid-operated brakes.

THE NEW HAVEN SHEARDIZING CO., NEW HAVEN, CONNECTICUT, has increased its capital stock from \$50,000 to \$100,000. It has also removed its factory to 868 Windsor street, Hartford, Connecticut, in order to have increased space and room for up-to-date equipment to permit doubling its capacity and make other expansion necessary in connection with contemplated new business with the rubber trade. Orders and correspondence should still be sent to New Haven, as the office of the company will remain there for the present.

¹Syracuse office, Westinghouse Electric & Manufacturing Co., East Pittsburg, Pennsylvania.

ELECTRICALLY DRIVEN RUBBER MACHINERY.

Standard General Methods for Testing Cotton Fabrics.¹

Serial Designation: D 39—18 T; Issued, 1915; Revised, 1916, 1918.

1. The following general methods are intended to be applicable for testing cotton fabrics. Where a material requires special treatment, specific methods will be described as they are developed for that material and such special tests shall have precedence over the general method.

I. CONDITION.

2. The dry condition of cotton fabric shall be understood to be absolute dryness obtained by placing the material in a ventilated drying oven maintained at a temperature of 105 to 110 degrees C. (221 to 230 degrees F.) and dried to constant weight as determined by two consecutive weighings without removal from the oven, to be taken not less than ten minutes apart, and to show a further loss of not more than 0.1 per cent of the previous weighing.

3. The standard condition of cotton fabric shall be understood to be the condition in which it contains 6.5 per cent of its dry weight of moisture.

II. TEST METHODS.

(A) LENGTH.

4. The length of a roll or piece shall be determined by running the cloth over a measuring drum of known circumference, from which the yardage is registered by a dial or counter driven by a chain or other positive or non-slip mechanism. Just enough uniform tension² is to be used on the cloth to keep it running flat and true.

B. WIDTH.

5. (a) The width of a roll or piece shall be determined at five different places uniformly distributed along the full length of the roll or piece, and may be determined at the same time as the total length.

(b) The average of the five measurements shall be the width.

(C) WEIGHT.

6. (a) **PREFERRED METHOD.**—The net weight of the roll or piece from which covering and binding have been removed shall be determined. The net weight of the roll or piece divided by its superficial area in square yards shall be taken as the normal net weight per square yard.

(b) **ALTERNATIVE METHOD.**—Three samples of known area, to contain not less than 4 square inches each, shall be stamped (preferably cut with a steel die) from one end of the roll or piece and quickly weighed. The normal square yard weight shall be computed from the average weight of these three samples.

7. (a) **PREFERRED METHOD.**—For the determination of dry weight two test specimens of approximately equal area, each not less than 4 inches in length and of the entire width of the fabric, shall be cut one from each end of the roll or piece. The one from the outside end of the roll shall be taken as soon as the wrapping is removed and the one from the inner end of the roll as soon as the inner end of the roll has been reached in running the roll. The two samples shall be taken as soon as possible. These samples shall be placed in a dry air-tight container, the weight of which has been previously determined, and carefully weighed therein and then removed (check weight being made on container), the net weight calculated and the sample dried to constant weight in manner described in Section 2. The difference between the original weight of sample and the dry weight is the loss of moisture which when computed as percentage of the dry weight is the percentage regain of the material. The dry

Speed of the pulling jaw, in. per min.	20	12	12	12
Number of specimens each, warp and filling	5	5	5	20 strand

Note 1. When material is less than 4 inches wide, the swatch shall be cut 24 inches long and the test specimens shall be laid out in such a manner that no part of any specimen shall come within 2 inches of either selvage.

Note 2. When the specified number of threads or picks per inch is in fraction, the number of threads broken shall include the fraction as a full thread.

TABLE II.—TENSILE STRENGTH: TEST METHOD CLASSIFICATION.

Name of Fabric.	Test Method No.	Humidity Conditions.
Tire fabrics, including	1	(a) Test specimens shall be tested in dry condition as defined in Section 2. They shall be taken out a time from the drying oven and broken in the testing machine within 30 seconds from the time of removal from the oven.
Carcass building fabric.	1	
Breaker strip.	1	
Cord fabric.	4	
Ducks, including	1	(a) Specimens may be broken in dry condition as specified above for tire fabrics, such tests to be captioned, "Tested Bone Dry."
Hose duck.	1	
Belt duck.	1	
Tent duck.	1	
Army duck.	1	(b) Specimens may be tested in their natural condition as taken from the roll or piece and corrected for the moisture present by the method of Section 12, such tests to be captioned, "Corrected for Standard Moisture Regain."
Enameling duck.	1	
Sail duck.	1	
Numbered duck.	1	
Drills.	1	Exposed before testing for at least two wires in an atmosphere of 65 per cent relative humidity and 70 degrees F. and tested in this atmosphere.
Sheatings.	1	
Yanabug.	1	
Coutils.	1	
Balloon Cloth.	1	
Wing fabric.	3	

¹Balloon cloth shall be tested on machine of the inclination balance type with maximum capacity of 400 pounds.

²The elongation of wing fabric shall be observed for each specimen when subjected to loads of 10 pounds, 20 pounds and 70 pounds. Wherever possible autographic records shall be taken.

Note.—Fabrics not included in the above list will be given a test method classification by Committee D-13 on application of those interested.

weight per square yard is then obtained from the normal weight per square yard as obtained in Section 6 (a), as follows:

$$\frac{\text{Normal weight per sq. yd.} \times 100}{100 + \text{percentage regain}} = \text{Dry weight per sq. yd.}$$

(b) **ALTERNATIVE METHOD.**—From one end of the roll or piece five specimens, each 3 by 4.32 inches, representing 0.01 square yard, shall be stamped (preferably cut with a steel die). Two specimens shall be cut near the selvages, one at the center, and the other two between the selvages and the center. These five specimens, with a total area equal to 0.05 square yard, shall be placed in the wire basket of a ventilated drying oven. The

¹Reported for adoption, American Society for Testing Materials.

²It has been suggested that a uniform tension of 2.5 times the weight of five running yards of the fabric will be sufficient to keep the fabric flat and preserve a proper relation for comparison of different fabrics. Invitation is extended to report to the committee the results of such tests upon different fabrics.

basket shall be so constructed with partitions, not less than $\frac{1}{4}$ -inch apart, that the specimens may stand on edge. The speci-

145	170	168	166	164	162	161	161</										

mens shall then be dried to bone dryness as described in Section 2. The combined weight of these specimens after drying represents the dry weight of 0.05 square yard of the fabric, and the dry weight per square yard of the roll or piece is obtained by multiplying the above quantity by 20.

8. If by the first tests the fabric fails to meet the specifications a second swatch shall be taken as follows: If the roll or piece is a complete warp, the second swatch shall be cut from the center of the roll or piece. If the roll or piece is a part warp, the second swatch shall be taken not less than 1½ yards from the other end.

9. The difference between the normal weight of the fabric, Section 6, and the dry weight, Section 7, is the amount of moisture present.

(a) When computed as percentage of the normal weight this is the moisture content of the material.

(b) When computed as percentage of the dry weight, this is the moisture regain of the material.

(D) NUMBER OF THREADS PER INCH.

10 (a) The number of threads per inch or count of the fabric shall be determined by counting a space of not less than 1 inch in at least five different places in the roll or piece.

(b) The average of the five determinations shall be the count³

(E) THICKNESS

11. (a) The thickness shall be measured by an automatic micrometer which presses upon at least 0.5 square inch of the fabric with a uniform constant pressure, and which is so mounted as to make measurements 6 inches from the selvage.

(b) At least ten measurements at different portions of the roll or piece shall be made, and the average shall be the thickness of the fabric.

(F) STRENGTH.

12. Tensile strength tests shall be made by one of the four methods described as follows in detail, and fabrics shall be tested by the method shown for the classification under which they fall. In each case the results shall be recorded separately for warp and filling.

For the determination of tensile strength a swatch of the length specified in Table I shall be cut the entire width of the cloth and test specimens shall be cut from this swatch according to the respective diagrams shown at the bottom of Table I.

Two methods of determining the tensile strength shall be recognized:

(a) **STRIP TEST (FIG. 1).**—Under this method a long narrow strip of the fabric shall be clamped at each end by the jaws of the testing machine and strained to the point of rupture.

(b) **GRAB TEST (Fig. 2).**—Under this method the testing machine jaws, each of definite width, shall be made to reach into the body of a rectangular piece of fabric and shall be clamped a definite distance apart. Care shall be taken that the same set of threads are embraced by both pairs of jaws. The specimen shall then be strained to the point of rupture.

13. CORRECTION FOR STANDARD MOISTURE REGAIN.—When it is

desired to test tension specimens for tensile strength, in the natural state in which they are cut from the roll or piece, the following method shall be employed to reduce the tensile strength found to the common basis of an assumed standard moisture regain equal to 6.5 per cent of the bone-dry weight:

(a) After preparing the specimens for the testing machine, those cut from the warp and those from the filling shall be weighed each in a separate batch under the natural moisture conditions which obtain at the time in the testing room.

(b) The specimens shall then be tested immediately, in as rapid succession as possible, by the method specified in Table II.

(c) After rupture the broken specimens (entire) shall be placed in the basket of an oven and dried as defined in Section 2.

³For tire fabric used for carcass building the number of threads per inch shall be determined by counting a space of 10 inches in at least five different places in the roll or piece, and the average of the five determinations shall be the count.

EXPLANATION: A sample of fabric in its natural state gave an apparent tensile strength of 210 pounds. After drying its moisture regain at the time of the test was found to have been 4.75 per cent of the dry weight. In the line opposite 210 and under 4.75 regain in the table, will be found the figure 227.2, the strength of the fabric corrected to a full regain of 6.5 per cent. In the same manner a fabric with an apparent strength of 192 pounds and a regain of 5.25 per cent would have a corrected strength of 202.9 as determined by interpolation from the table.

FIG. 1.—Illustration of Strip Test.

FIG. 2.—Illustration of Grab Test.

(d) The total warp and filling specimens shall be grouped each by themselves, forming two batches. The aggregate dry weight of the warp and filling specimens shall thus be obtained and the moisture regain at the time of the test determined.

(e) The following formula shall then be applied, based upon the assumption that the standard moisture regain of manufactured cotton is 6.5 per cent of the dry weight, that the actual percentage regain is between the limits of 3 and 6.5 per cent of the dry weight, and that for 1 per cent of moisture regain there is an increase of 6 per cent in the tensile strength of the fabric.

$$\frac{\text{Tensile strength corrected}}{\text{to standard moisture regain}} = \frac{(\text{Tensile strength from machine reading}) \times 139}{100 + 16 \times \text{Actual Percentage Regain}}$$

Example. A specimen of fabric broken under natural conditions gave a tensile strength of 224 pounds as read from the machine dial. By weighing before and after drying the specimen was found to contain a moisture regain equal to 3 per cent of the bone-dry weight. The tensile strength corrected to a common basis of 6.5 per cent moisture regain would therefore be

$$\text{Tensile strength corrected} = \frac{224 \times 139}{100 + (6 \times 3)} = 346 \text{ pounds.}$$

STANDARD SIZES FOR CHECKS AND INVOICES.

The Standardization Committee of the Purchasing Agents' Association has evolved several aids for both seller and purchasing agent or accounting officer.

The committee considered as the standard check size, $3\frac{1}{2}$ by $8\frac{1}{2}$ inches, which has already been adopted by over 100,000 business houses, with Federal Reserve Board Approval. The fact that most of these business concerns use a voucher check just double the size of the standardized check, and file the original invoice with a copy of the voucher, led to the selection of $8\frac{1}{2}$ by 7 inches as the master size for the standardized invoice.

On account of filing devices, any other sizes selected should be such that they readily fold to $8\frac{1}{2}$ by 7 inches, so $8\frac{1}{2}$ by 7, $8\frac{1}{2}$ by 11, and $8\frac{1}{2}$ by 14 inches were the sizes preferred. It was decided to allow the printing to run either way of the sheet, to suit the sales organization.

G. H. Money of the Federal Rubber Co., Cudahy, Wisconsin, is one of the members of the Standardization Committee.

DETERMINATION OF SULPHUR IN VULCANIZED RUBBER.¹

P. Dekker has subjected to accurate investigation some methods for determining free sulphur (in the acetone extract) and of the combined (and total) sulphur, described in recent

¹ "Communications of the Netherlands Government Institute for Advising the Rubber Trade and the Rubber Industry," Delft, Holland.

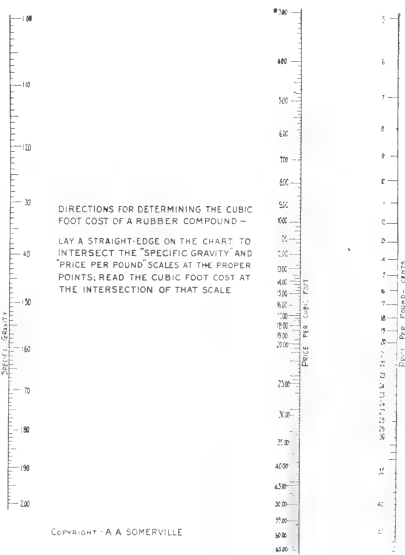

² Should insoluble sulphates remain behind on the filter, they are fused with potassium-sodium carbonate.

literature. As a result of this study the following method has been adopted by the Netherlands Government Institute at Delft for the determination of combined and total sulphur:

One gram of the sample is gently heated in an Erlenmeyer flask of 200 to 300 cc. with 40 cc. nitric acid (specific gravity 1.4) and 6 grams of magnesium nitrate free of water till the liquid begins to foam, when the flame is removed. In case the foaming is so strong that there is danger of overflowing, the flask is cooled for a moment. As soon as the foaming has ceased it is gently boiled for one hour, then one to two drops of bromine are added and boiling continued for one-half hour. The liquid is then placed in a porcelain dish and evaporated nearly to dryness, 10 cc. strong hydrochloric acid is added and further evaporated till the residue becomes solid on removing the still liquid mass from the water bath. The residue is then dissolved in warm water, filtered, and sulphuric acid determined in the usual manner.²

CHART FOR DETERMINING THE COST PER CUBIC FOOT OF RUBBER MIXINGS.

A simple and direct method of determining the cubic foot cost of a rubber compound is here reproduced. The chart was de-

signed and copyrighted by Dr. A. A. Somerville of the R. T. Vanderbilt Co. for free distribution to rubber chemists and compound men. It is of the well known "alignment" type, consisting of three mathematical scales covering a complete range of practical compounding possibilities, namely, a specific gravity scale from 1.00 to 2.00; a cost per pound scale from 5 to 50 cents, and a cubic foot scale covering all resultant combinations of the other two scales.

JUDICIAL DECISIONS.

GOOD WEAR TIRE & TUBE CO. ENJOINED.

FEDERAL TRADE COMMISSION '76. SOPHIE COHN, SAMUEL M. CHAZANOFF AND B. COUNSELBAUM, doing business under the firm name and style of THE GOOD WEAR TIRE & TUBE CO.

The respondents formed a copartnership in March, 1920, under the name The Good Wear Tire & Tube Co., with their principal place of business in Chicago, Illinois, and engaged in manufacturing and selling reconstructed tires, buying second-hand and unserviceable tires, cementing and sewing them together, and advertising them as "Double Tires" with no hint of their composition, leading the public to believe they were made of new and unused material. Moreover, they had full knowledge of the existence and character of The Goodyear Tire & Rubber Co. and of the confusion the name they had taken would cause.

They are forbidden to use the name "Double Tread" for the tires they make, unless they add words which will show unmistakably that the tires are not made of new and unused material. They are also forbidden to use in interstate commerce the name, The Good Wear Tire & Tube Co. or any other name that resembles that of The Goodyear Tire & Rubber Co. (Federal Trade Commission, Docket 403, Washington, D. C., January 29, 1920.)

ACCEPTANCE TELEGRAM BINDS RUBBER CONTRACT.

FRED STERN & CO. VS. THE B. K. STURGIS CO.—United States District Court, Ninth District, San Francisco, May 25, 1920.

Damages claimed on account of failure to accept delivery of rubber shipments made during 1918. Acceptance was by telegram, with statement that contract would follow. Judge Rudkin held that the telegram was a binding contract, even though the words were embodied in the telegram that a contract was to be mailed; and that all the jury had to do was to fix the amount of the plaintiff's damages. Through a mistake the jury scattered and the case had to go on the next Court calendar.

CHARGES MISUSE OF NAME.

The McElrath Tire & Rubber Co., Ravenna, Ohio, has been granted a temporary injunction by Judge A. S. Cole, under \$5,000 bond, against The McElrath Building Co., of the same town. It charged that the use of the name "McElrath" by the defendant company was an artifice intended to defraud both the plaintiff company and the public, there being no person of that name connected with the defendant company.

TUFFORD HEEL PATENT AGAIN SUSTAINED.

In an opinion handed down last month by United States District Judge Arthur L. Brown, the I. T. S. Rubber Co., of Elyria, Ohio, is sustained in its infringement suit against the United Lace & Braid Manufacturing Co., of Rhode Island. The action was brought in the Federal Court of Rhode Island some months ago. The plaintiff alleged that the defendant was infringing on its reissued latters patent No. 14,049 of January 11, 1916, in the manufacture of rubber heels. Judge Brown in his opinion declared: "I am of the opinion that claims five, six, and seven of the Tufford patent in suit are valid and infringed, and a draft decree may be presented accordingly."

CUSTOMS APPRAISER'S DECISIONS.

No. 43,624. Protest 851,889 of William Wrigley, Jr., Co. (Chicago.) CHICLE.—Held that dessicated chicle is properly classified as refined, and held dutiable at 20 cents a pound. (Treasury Decisions, Vol. 38, No. 12, March 18, 1920.)

No. 43,670. Protest 851,879 of G. W. Sheldon & Co. (Chicago.) CHICLE.—Dessicated or dried chicle is properly classified as refined, and dutiable at 20 cents a pound, not at 15 cents a pound as crude chicle. (Treasury Decisions, Vol. 38, No. 15, April 22, 1920.)

No. 43,694. Protest 933,528 of G. Amsinck & Co. (New York.) GUM CHICLE by similitude (on authority of Treasury Decision 38,382) is declared not dutiable at 20 cents a pound, but dutiable at 10 per cent ad valorem. (Treasury Decisions, Vol. 38, No. 17, May 6, 1920.)

No. 43,690. Protest 932,747 of The Rubber Association of America. GUM CAUCHILLO, invoiced as balata and classified by similitude at 15 cents a pound, is held properly dutiable at 10 per cent ad valorem. Treasury Decisions, Vol. 38, No. 17, May 6, 1920.)

No. 43,769. Protest 933,383 of Clauss Portenoy Co., New York. CRUDE CHICLE.—Chicle gathered as sap and subjected to no other process than boiling, to bring about coagulation, and sundried. Held to be crude and dutiable at 15 cents per pound. (Treasury Decisions, Vol. 38, No. 23, June 17, 1920.)

No. 38,382. Protest 931,382 of Rubber Association of America et al. against assessment of duty by the collector of customs at New York; reversed in part. Board of United States General Appraisers.

GUM.—Certain gums invoiced as: crude gum chicle, chicle, Colombia gum, cauchillo, sande, gum colombiana, goma tousle, crude chicle, goma sande, colombiana, and goma chicle, were assessed at 15 cents a pound, as if they were chicle, under the similitude clause of paragraph 386 of the Tariff Act of 1913. Held that they are not similar in material, quality, or texture to the chicle provided for in paragraph 36, and should be classified as non-enumerated unmanufactured articles. (Treasury Decisions, Vol. 38, No. 16, April 29, 1920.)

CAUCHILLO GUMS.—The Assistant Secretary of the Treasury on May 12, 1920, called upon the Assistant Attorney General to appeal to the United States Court of Customs Appeals against the decision in No. 38,382. (Treasury Decisions, Vol. 38, No. 19, May 27, 1920.)

UNITED STATES VS. AMERICAN CHICLE CO. (No. 2014).—United States Court of Customs Appeals, March 24, 1920. Decision of Board of United States General Appraisers (No. 38,152) affirmed. CRUDE CHICLE.—Chicle conveyed to Canada from Mexico and there reduced to small particles and repacked, has not been advanced in quality or value; it therefore pays only 15 cents a pound duty. (Treasury Decisions, Vol. 38, No. 14, April 15, 1920.)

"TENAX" ASBESTOS SHEET PACKING.

To enable shop owners to make their own gaskets, one manufacturer has provided

"TENAX" ASBESTOS PACKING.

extremely hot temperatures, trims easily, requires no following up, and does not squeeze out of the joint or "fry" under high temperatures. (Advance Packing & Supply Co., 78 East Lake street, Chicago, Illinois.)

factor has provided asbestos packing pressed in sheets 50 by 50 inches, ranging in thickness from 1/32 to 1/8-inch, besides one special 1/64-inch sheet which is black graphited. The standard color is blue and is known as "the original blue sheet." "Tenax" compressed asbestos sheet packing is intended for use on the engines of automobiles, gas engines, trucks, tractors, etc. It is claimed for it that it will resist extremely hot temperatures, trims easily, requires no following up, and does not squeeze out of the joint or "fry" under high temperatures. (Advance Packing & Supply Co., 78 East Lake street, Chicago, Illinois.)

The Manufacture of Blow-Out Patches.

By Arthur C. Sprues.

BLOW-OUT PATCHES are emergency accessories that are always carried in the repair kit of every cautious motorist who anticipates the time, that usually comes unexpectedly, when

the need is urgent. They are intended for an emergency repair and a protection to the inner tube in case of a blow-out or fabric break, and may be easily and quickly applied on the road.

Blow-out patches are made by tire and other rubber manufacturers specializing in tire sundries. There are two types of inside blow-out patches, the fabric and the cord. The former is intended for fabric tires and is provided with flaps that extend outwardly between the beads and the rim, thereby holding the patch firmly in place. The cord patch is designed for cord tires,

The manufacture of blow-out patches includes the wrapped and molded processes, the former being the most commonly used, method and is briefly described as follows: A roll of 13-ounce cotton duck, 36 inches wide and about 50 yards in length, is thoroughly dried to free it from moisture. A length of pipe is passed through the center of the roll, which is then placed horizontally in bearings, and the free end of the fabric is passed between the middle and lower roll of the calender and fastened to the stock shell. Previously, the rubber stock is compounded and mixed on a two-roll mill. The formula commonly used consists of:

Smoked sheet	22	pounds
Whiting	12	pounds
Litharge	3	pounds
Sulphur	1½	pounds

CALENDERING.

The calendering is done on a three-roll calender. After the rubber dough has been warmed up on a special warming mill, it is placed between the upper and middle rolls of the calender, and when the calender is started and adjusted, the rubber passes in a thin sheet on the middle roll which is somewhat hotter than the top roll. This sheet is transferred by pressure of the rolls to the fabric that passed between the middle and lower rolls and the frictioned-fabric is then wound up on the stock shell with a cotton liner between the rubber surfaces to prevent their sticking together. The speed of the bottom roll is somewhat slower than the other two for the purpose of forcing or frictioning the rubber through the interstices of the fabric.

CUTTING.

The roll of calendered fabric is then mounted at one end of the cutting table and a length of stock is unrolled and laid on the table, meanwhile, the liner is stripped off and wound up for further use. The stock is then cut on the bias according to the sizes required.

ASSEMBLING.

The next operation is assembling or building up the patches. This is done on a hollow metal core that conforms in section to the shape of

the tire casing in which the patch is intended to be used. A coating of cement is first applied to the core that is mounted on any ordinary tire building stand. The next step consists in applying the largest ply of fabric to the core, allowing the rim-flaps to extend downward and

BUILDING OPERATIONS.

although it may be used in a fabric tire repair. The cost of this patch, however, does not warrant such use, as a fabric casing break tends to increase, and therefore should be properly repaired and vulcanized. An injury to a cord casing does not have a tendency to grow larger, hence the cord patch can be applied with cold patching cement and may wear as long as the tire. However, a vulcanized repair is undoubtedly more permanent.

While the process of making inside blow-out patches varies somewhat among manufacturers, fabric patches are usually built up from four superposed plies of bias frictioned fabric of equal width, each ply being stepped down longitudinally. The cord patch is built up from bias cord fabric in the same way and the edges of both types are tapered to a fine edge.

This first-ply is given a coating of cement and the second ply is laid on the first, and so on until the four-ply patch is assembled. Each ply, however, should be rolled down smoothly and all air pockets between the plies carefully removed. As many patches as the circumference

of the core will accommodate are built up in this way, when the flaps are dusted with soapstone and turned back against the body of the patch and the cloth wrapping applied.

VULCANIZING.

The assembled, cloth-wrapped patches are now ready for vulcanizing or curing, as it is commonly called. This is done in a horizontal, open steam vulcanizer. The cores, with their assembled and cloth-wrapped patches, are hung on stationary metal rims within the vulcanizer and about 38 pounds of steam pressure applied for 38 minutes.

After the cloth wrapping is unwound the patches are stripped from the core and dusted with soapstone, when they are ready to be marked and packed.

ZWEBELL'S HINTS TO REPAIRMEN. THE NON-SKID IMPRESSION PAD.

The impression pad is used for retaining the non-skid pattern on tires or for reproducing it on tread sections, etc. When the non-skid pattern is being replaced, soapstone can be used to fill with and good work obtained. However, there is no pressure obtained by the use of soapstone, and for this reason the impression pad is found to be the best.

(1.) Pads are made to fit the molds, and are usually the length of the mold.

(2.) When applying the pad on the tire, place it beyond the point of injury, and where the non-skid design is in first-class condition. The pad can be tied on so it will adhere and not slip.

(3.) When making an impression pad, make it right. Take a ply of reclaimed fabric of the proper length and width. Buff and cement the fabric and place on this two layers of 1/16-inch tread gum, or more, if the non-skid is deep, and then cure. The result is a strong non-chipable pad that will last for seventy-five cures or more without losing the impression.

(4.) Impression pads are inexpensive and better when reclaimed fabric is used. Scrap, waste or dirty gum is used between the fabric and the last ply of gum coming in contact with the tire.

PNEUMATIC TRUCK TIRES WITHSTAND SEVERE TESTS.

W. V. Logan of the United States Tire Co., in a paper read before the metropolitan section of the Society of Automotive Engineers in New York, May 12, 1920, on the development of the pneumatic truck tire, told of some interesting experiments that have been made. The story of the working out of the idea of applying pneumatic tires to heavy trucks since it was first formed in 1909, with the enumeration of the advantages to be gained,

THE JUMPING TEST.

formed the main portion of the address. At the close, Mr. Logan showed in moving pictures exactly what takes place in a solid or a pneumatic truck tire when subjected to excessive shocks and strains. The tests were made at the truck tire factory of the United States Rubber Co.

All the trucks, except the 5-ton truck in the gutter jump, were loaded beyond their rated capacity; the speed was between 17 and 20 miles an hour. The platform from which they jumped was 1½ feet high. The deflection of the tires as they struck the ground was 50 per cent of their cross-section diameter.

The jumping truck weighed 10,800 pounds loaded, and the tires used were six-inch in front and eight-inch in rear. The same truck took gutter and curbstone tests as well as the jump tests. In eight jumps there was not a blow-out nor tire trouble of any kind, and after the tests the four tires were taken off and dissected but not a break nor a scratch was found on the inside of the casings. Moreover, after eight or nine jumps had been made, all on the same identical spot, absolutely no harm was done to the concrete road. It was found that the impact of the pneumatic tired truck on the surface was two-thirds less than the impact of a solid tired truck.

DEVELOPMENT OF THE SIX-WHEEL TRUCK.

P. W. Litchfield, vice-president and factory manager of The Goodyear Tire & Rubber Co., expressed his views on tires and their future at the dinner given by the company to the Cleveland and Detroit sections of the Society of Automotive Engineers at Akron, Ohio, in May last. After an interesting review of the history of transportation, in which he showed how street-cars must give way to motor buses, and prophesied

INSTEAD OF TWO GIANT PNEUMATIC TIRES, EACH WEIGHING 398 POUNDS, THE TANDEM AXLE CONSTRUCTION PERMITS THE USE OF FOUR 40 BY 8 PNEUMATIC TIRES, EACH WEIGHING ONLY 119½ POUNDS.

the disappearance of railroads, he turned to the question of truck tires. He believes that the pneumatic-tired truck and the long-distance truck can handle in the future the passenger and freight business, now managed entirely by the railroads. Larger loads and longer distances make possible an enormous increase in the volume of the motor truck business, but the use of the truck is very limited if solid tires are used, as greater speed and carrying capacity are obtained with pneumatic tires. Larger units must be employed; 3-ton and 5-ton trucks have been used and the tires for 3-ton sizes are being rapidly changed to pneumatic equipment. Largely as an experiment the Akron-to-Boston express was started, and it proved an excellent tire-testing experiment. It was learned that while it is not difficult to make 12, possibly 15 and perhaps 20-inch tires, it is questionable whether they are the tires for this service. When considering 10 and 12-ton trucks it was found that the truck body and center of gravity were too high. The remedy was to use multiple wheels, that is, more than four, say six; four wheels have proved inefficient on European railroad cars as compared with American freight cars, and that holds good for motor trucks also. The truck should be on tandem wheels and not on twin tires on the same wheel and the riding quality and carrying conditions will be better. By putting the extra wheels under the rear end of the truck body the damage to tires is avoided, which follows with large single tires, because tires are distorted with a big body overhang, and more traction is obtained with a four-wheel drive.

War Department Specifications for Mechanical Rubber Goods—II.

WAR DEPARTMENT SPECIFICATIONS No. 333-1-1, referred to in the following, were published in **THE INDIA RUBBER WORLD**, January 1, 1920:

COTTON RUBBER-LINED FIRE HOSE.

War Department Specification No. 333-1-7—June 5, 1919.

GENERAL.—(a) This specification covers the requirements for cotton rubber-lined fire hose.

(b) See War Department Specification No. 333-1-1, headed **General Specification for Mechanical Rubber Goods**¹, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications and following table.

(a) Shall be made of single or double jacketed cotton cover as may be directed and a rubber lining.

(b) The cotton cover shall be circular woven, seamless, or one ply or two separate plies as may be specified. Free from foreign matter and imperfections. The filling shall be a high ply yarn and the warp a lower ply yarn.

(c) The rubber lining shall be uniform throughout, consisting of not less than three calendered sheets lapped at the seam into one solid body, properly vulcanized. It shall be as free from corrugations as is consistent with good practice and not less than 0.058-inch in thickness for 2½-inch hose and not less than 0.049-inch for 1½-inch throughout, exclusive of backing.

(d) **FITTINGS.**—Each length of hose shall be properly fitted into brass couplings of the following composition:

	Per Cent.
Copper, not less than.....	83
Tin, not less than.....	5
Zinc, not more than.....	7
Lead, not more than.....	3

NOTE.—0.5 per cent charcoal iron may be used if desired.

All surfaces shall be machine finished except the corrugations in the tail parts. The thickness of metal shall not be less than 5/32-inch at any one point. The diameter of the waterway shall be as near 2½ inches as possible and not less than 2¼ inches, being determined by keeping the thickness of metal between the bottom of thread and surface of the waterway not less than 5/32-inch. Each 2½-inch coupling shall be provided with two expansion rings, which shall have smooth, rounded edges and shall be not less than 0.050 and not over 0.058-inch in thickness; not less than 1½ inches in length and at least ¼-inch shorter than the tailpiece. Each 1½-inch coupling shall be provided with two expansion rings of suitable size to guarantee satisfactory performance. Two spanner lugs shall be provided 9/16-inch in diameter and 9/16-inch in length for 2½-inch hose and ½-inch in diameter and 7/16-inch in length for 1½-inch hose, both on the swivel and the male end, and shall conform to dimensions, marked with manufacturer's name, month and year of manufacture, and the words "U. S. A."

(e) **THREADS.**—Shall be standard iron-pipe size for 1½-inch hose and "National Standard" fire-hose thread for 2½-inch size unless otherwise specified in the proposal or order.

(f) **GASKETS.**—Three shall be provided with each coupling, one in the swivel and one in each end underneath expansion rings; all exactly fitted, 3/16-inch in thickness, and of the same composition as the rubber tube.

BRANDING.—See General Specifications.

(a) Stenciled in black with indelible ink, letters at least 1 inch high in two places on each length 2 feet from the couplings, with the words "U. S. A. FIRE," manufacturer's name, and date.

MATERIAL.—See General Specifications.

(a) Lining and washers shall contain not less than 35 per cent of fine Pará, nor more than 4 per cent sulphur, with the remainder suitable dry inorganic mineral fillers. The uses of reclaimed rubber or rubber substitutes will not be permitted.

INSPECTION.—See General Specifications.

(a) From each shipment of 20 lengths or less the inspector may select one length at random, and cut from it a 1-foot section for tests.

TESTS.—See General Specifications and following table.

(a) Each length of hose with couplings attached shall be subjected to pressure test. Twist shall be in a direction to tighten the coupling. Hose shall not leak, sweat, nor rupture the threads of the cotton cover.

(b) For physical tests an 8-inch section shall be cut from sample after burst.

(c) Friction test to be conducted on a specimen 1½ inches long.

(d) Samples after being subjected to a dry heat of 158 degrees F., plus or minus 2 degrees, for 96 hours must have a tensile strength of at least 900 pounds per square inch.

(e) Chemical test shall be made on the tube properly separated from the cover, buffed free of backing and properly prepared. The acetone, alcoholic potash, and chloroform extract, ash, and total sulphur together shall not exceed 67 per cent by weight of the total compound. Free sulphur must not exceed 1.25 per cent by weight of the total compound. The acetone extract shall not exceed 4 per cent. The alcoholic potash shall not exceed 1.5 per cent. The chloroform extract must not exceed 2 per cent. The total sulphur, exclusive of barytes, must not exceed 4 per cent, and the ash shall not be greater than 57 nor less than 50 per cent by weight of the total compound.

(f) Elongation and twist measurements shall start with hose filled with water at 10 pounds' pressure.

(g) One length from every 10 shall be given the kinking test, which shall be conducted by kinking the hose 18 inches from one end by tying the coupling back against the hose.

(h) A 3-foot section shall be cut from at least one length in every sixty 50-foot lengths for bursting test.

TABLE.

	Size, Inches.		
	1½	2½	3

Before aging, minimum.....lbs.	1,600	1,600	1,600
After aging, minimum.....lbs.	900	900	900
Ultimate elongation, minimum.....inches	2-12	2-12	2-12
Permanent set:			
Stretch 10 minutes, then release, minimum.....inches	2-10	2-10	2-10
Per cent set after 10 minutes' rest, maximum.....	25	25	25

GASOLINE HOSE.

War Department Specification No. 333-1-8—June 5, 1919.

GENERAL.—(a) This specification covers the requirements for hose to be used in conveying gasoline.

(b) See War Department Specification No. 333-1-1, headed **General Specification for Mechanical Rubber Goods**¹, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications and following Table II.

(a) Tube when made from rubber sheet shall consist of at least two complete turns, reinforced at lap into one solid body.

(b) Hose to be made of braided or fabric plies.

(c) Washers to be made of leather 1/16-inch in thickness.

BRANDING.—See General Specifications.

(a) Use the word "Gasoline."

MATERIAL.—See General Specifications and following Tables I and II.

(a) Tube, cover and friction, shall contain not less than 25 per cent of fine Pará, and not more than 1 per cent free sulphur.

INSPECTION.—See General Specifications.

(a) Inspector may cut at random a three-foot section for each shipment of 1,000 feet or less.

TESTS.—See General Specifications and following Table II.

(a) A length of hose with couplings attached after having been filled with gasoline for two hours shall withstand a pressure test as in Table II.

¹See "THE INDIA RUBBER WORLD," January 1, 1920, page 214.

²Tests shall be conducted on each length.

(b) FLEXIBILITY.—By flexibility is meant ability to bend without kinking. When hose of internal diameter (Y) is bent around a cylinder having diameter equal to (X) times the external diameter of hose as in the following table, the external diameter of hose shall not increase or diminish by more than 10 per cent.

TABLE I.

Internal diameter.	Less than $\frac{1}{4}$ to $\frac{1}{2}$ inch to above—			
(Y).....inches	$\frac{1}{4}$	$\frac{3}{4}$	$1\frac{1}{2}$	$1\frac{1}{2}$
(X).....inches	8	12	14	16

(c) DRY HEAT.—A 3-inch piece of hose shall be subjected to dry heat at 132 degrees C. for two hours, and after cooling it shall not be tacky nor show any tendency to crack.

(d) PERMEABILITY.—(The specific gravity of the gasoline used in this test should be between 0.710 and 0.725 at 15.5 degrees C., 65 per cent of it must distill over at 100 degrees C. from a distillation flask when the bulb of the thermometer is just below the side tube.) A 14-inch length of the hose is held vertically and plugged at the bottom.

The upper end is fitted with a glass tube about 18 inches long. The hose so arranged is filled with gasoline to a head of 12 inches above the top of the acting length of the hose. The acting length of the rubber hose is 12 inches. The upper end of the glass tube is loosely closed with a cork.

During the first 24 hours the level of the gasoline will fall comparatively rapidly. The loss of gasoline is made good by frequent additions from a known volume of gasoline, care being taken that the level of the gasoline in the glass tube does not fall at any time by more than 3 inches. This test is to last for 72 hours, and the loss of gasoline during the third 24 hours shall not exceed 100 c. c. per square foot of the original internal surface of the hose.

(e) IMMERSION IN GASOLINE.—A 3-inch piece in the hose is boiled for one hour (using a reflux condenser) in gasoline similar to that used for the permeability test. The gasoline is allowed to cool down. Twenty-four hours later the test piece is removed from the gasoline and examined without delay as follows:

The internal diameter at the point of greatest constriction is measured by means of rod gages. From this measurement the area of the bore is calculated. It shall not differ from the original by more than 25 per cent.

The test piece is then cut longitudinally into halves, and the adhesion between rubber and cotton carefully examined. The adhesion shall be of such a character that the rubber can only be stripped from the cotton by hand with difficulty.

(f) IMMERSION IN OIL.—A 3-inch piece of the hose is immersed in medium gas-engine cylinder oil at a temperature of 100 degrees C. for 8 hours, and for a further period of 24 hours at ordinary temperature. The oil is then wiped from the surface of the hose. The decrease of internal diameter shall be less than 10 per cent.

The flexibility and elasticity of the rubber shall not be diminished and there shall be no tendency of the rubber to separate from the cotton.

PNEUMATIC HOSE.

War Department Specification No. 333-1-10—June 5, 1919.

(A) ROCK-DRILL HOSE. (B) PNEUMATIC-TOOL HOSE.

GENERAL.—(a) This specification covers the requirements for pneumatic-tool and rock-drill hose for conveying air under pressure.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the words and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Dimensions: See the following table.

(b) The fabric plies of pneumatic tool hose shall be of sheeting or a plain weave fabric.

(c) The fabric plies of rock-drill hose shall be of duck.

BRANDING.—See General Specifications.

(a) Use word "Pneumatic" on pneumatic hose.

(b) Use words "Rock Drill" on rock drill hose.

MATERIAL.—See General Specifications.

INSPECTION.—See General Specifications.

TESTS.—See General Specifications and following table.

(a) When test pieces are stretched 2 to 9 inches at the rate of 20 inches per minute, the stress upon the tube shall be at least 900 pounds, that upon the cover at least 700 pounds per square inch.

SUCTION HOSE.

War Department Specification No. 333-1-12—June 5, 1919.

GENERAL.—(a) This specification covers the requirements for hose used for the removal of water by means of suction pumps.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Dimensions: See table following.

(b) Smooth bore.—Shall be made with an inner rubber tube, a helix of wire with rubber filling between the spirals; a second layer of rubber; cotton canvas layers; and an outer rubber cover.

(c) Rough bore.—Shall be made with an inner helix of wire covered with a layer of cotton canvas; the spaces between the wire filled with rubber in such a way that the cotton canvas is worked inward, making the passage through the hose as smooth as possible; a layer of rubber; cotton canvas layers; and an outer rubber cover.

(c) Suction strainers shall be furnished only when specifically called for in the proposal.

(d) The ends of each length shall be capped with the same rubber compound as used in the tube.

(e) The rough bore helix shall be of heavily galvanized flat iron wire, with rounded edges; the smooth bore helix shall be of heavily galvanized or copperized flat or round wire; each complying with table. The spacing between the adjacent wires shall be filled with rubber strips of the proper thickness and same quality of rubber compound as used for the tube. The rubber strips shall be of sufficient thickness so that when the hose is made up complete, the outside of the hose shall not show appreciable corrugations. The helix shall end at such a distance from the end of the hose that it will extend over the tailpiece of the coupling about 1 inch when the hose is trimmed and the coupling attached. The end shall be properly secured and the space thus left for the attachment of the coupling shall be filled with well-frictioned cotton canvas layers of the same material as is used in the body of the hose. The fabric placed under the wire at the end of the rough bore hose shall not extend within the hose more than 3/4-inch beyond the end of the shank of coupling.

BRANDING.—See General Specifications.

(a) Use word "Suction."

MATERIAL.—See General Specifications and following table.

(a) Tube, cover, filler, layer, washers and friction shall be properly vulcanized and contain not less than 35 per cent by weight of fine Para rubber; not more than 3 per cent by weight of sulphur, with the remainder suitable dry inorganic mineral fillers.

INSPECTION.—See General Specifications.

(a) With each lot of 50 lengths or less the contractor shall

GUTTA PERCHA IN THE PHILIPPINES.

The Honorable Dionisio Jakosalem, Secretary of the Department of Commerce and Communications of the Philippines, writing in regard to the exports of gutta percha from the Philippines, states that most of the gutta percha produced in the Philippines is exported through the ports of Jolo and Zamboanga to Singapore, from whence it goes to Europe. The product is thus wrongly credited to the Federated Malay States. His office is now conducting an investigation to find out why that product is not exported directly from Manila to the United States.

He points out that in 1915 the Philippine export of gutta percha amounted to 31,650 kilos, valued at 31,143 pesos, and in 1919 to 38,030 kilos, valued at 36,942 pesos. One thousand kilos equals a ton of 2,200 pounds, a peso equals 50 cents, United States currency. The Secretary believes that the volume of our export to the United States can be considerably increased through the employment of American buyers in the Philippines with the establishment of a reliable market in the United States where direct shipments may be handled.

A while back, when the laying of another transpacific cable was under discussion, it was alleged that the necessary gutta percha for insulation could not be secured as Great Britain had control of the world's supply.

The supply of gutta percha that can be secured in the Philippines is incalculable. It is classed as a minor forest product and is brought in by members of the non-Christian tribe, who live in the forests, in small quantities when they are in need of funds. No systematic effort has been made to secure a larger supply and the competition among the Chinese traders for that which is produced is not very keen.

The Secretary also points out the existence of extensive areas for the cultivation of rubber plants which are available; and that great opportunities and ample government protection are offered American and foreign capital invested in the islands. (James I. Rafferty, Philippine Commercial Agency, New York City.)

TESTING MACHINES.¹

A SURVEY of the types of testing machines used in various countries for testing textile materials divides them into two distinct classes: (1) constant increment of load; (2) constant increment of stretch.

The constant-increment-of-load machines apply the load by uniformly increasing the tension in very small increments. There are a few isolated cases in which the load is increased by appreciable amounts at stated intervals of time.

The constant-increment-of-stretch machines apply the load by stretching the material at a uniform rate, and because of their simplicity and rapidity of operation have found much favor with textile men both in this country and abroad.

The progress of testing-machine development in England, particularly during the war, is rather interesting. For a long time the two types of machines were in general use, but the constant-increment-of-stretch machine was the one most used. At the beginning of the war the problem of studying aircraft fabrics was given to the National Physical Laboratory, which has much the same relation to English industry as the Bureau of Standards has to American industry. In the study of such fabrics, it is extremely desirable that a machine be used that will give tests which do not involve machine characteristics. In this connection the Avery testing machine has been developed and the English Government insists that all aeronautical fabrics be tested on that particular machine.

The Avery machine is illustrated in Fig. 1. Its principle is not new, but the mechanical design is quite an improvement upon the Goodhand and Smith machines of this type. It consists

briefly of a compound lever, having at one end of the system a shot container so arranged to allow of a uniform rate of inflow and at the other end a fabric clamp. The shot container is allowed to be uniformly increased in weight and the balance beam kept at zero by taking up the stretch of the sample. Provision is made to cut off the supply of shot at the time of breaking of sample. A spring balance interposed between the shot container and balance arm allows the increase of weight of the container to be quickly observed.

It has been observed that within certain limits a change in the rate of loading produces practically no change in the physical properties of the material. The Avery machine is operated in accordance with specifications, within these limits and as a result the rate of loading varies with the kind of material being tested.

FIG. 1.—AVERY FABRIC-TESTING MACHINE.

A, LOWER GRIP; B, UPPER GRIP; C, HAND WHEEL; D, RESERVOIR; E, CAN; F, STEELYARD; G, STEELYARD PIVOT; H, LEVER; I, LINK; J, SWITCHING MECHANISM; L, SPRING BALANCE; M, CHUCKING CAN; N, SLIDING POISE; O, RECEPTACLE; P, SCREW; R, VERTICAL SCALE.

The development and use of this machine show a very careful study and consideration of the tensile properties of the material to be tested. The machine is theoretically very good, but the personal equation and time of operation is so large that its practical utility is questioned.

If the constant-increment-of-stretch machine had no machine characteristics, the results of tests on this type of machine would

correspond with those obtained from a constant-increment-of-load machine, provided both were operated between the limits that define the relations of stretch, load and time, within which a change in the rate of load application produces only a slight change in properties.

The constant-increment-of-stretch machines may be classified according to the method of recording the load transmitted by the fabric: (1) inclination balance; (2) elastic system (such as a spring).

The rigidity of construction, ease of operation and so-called "dead weight" feature of the inclination balance type of head—together with the fact that springs were not, in the past, constructed to give constancy of operation—has caused the first type to be used universally in this country and in Germany. This type is illustrated in Fig. 2.

The theory and calibration of an inclination balance machine assumes a null method of weighing, that is, the balance or poise arm is at rest. This condition is entirely changed during the

test by the inertia of a moving balance arm. The calibration is, therefore, not applicable to the machine as used. The error may be expressed as a function of the mass of the moving body multiplied by the acceleration. Obviously the acceleration changes with each different kind of material, shape and size of specimen, and speed of operation, and the total inertia component changes with the design and capacity of the machine. This is particularly emphasized in testing the same fabric on machines of different capacities; it is an established fact that results are different. From this it is readily seen that the results of tests of different fabrics on machines of the same capacity are influenced materially by the machine characteristics. All tests made on such machines include machine characteristics which vary with the variables of the test specimen, including nature of material, dimensions of test specimen, and rate of testing.

FIG. 2.—SCHOFFER FABRIC-TESTING MACHINES, INCLINATION BALANCE TYPE.

A, LOWER GRIP; B, UPPER GRIP; C, INCLINATION BALANCE; D, CYLINDER; E, RATCHET SCALE; F, FINGER; G, PAWL.

The use of this machine to check up deliveries is quite reasonable, for it is assumed that the machine characteristics are included in the specifications automatically and are constant for any one fabric and any one size and type of testing machine. Specifications based on tests made on this type of machine should specify the size, type and make of machine and rate of operation, as well as the specimen dimensions.

For investigational work, however, such as the comparison of the properties of different fabrics and the determination of the effect of varying the size of sample, it is clear that the results are very misleading if they include machine characteristics. The errors introduced become infinitesimally small as the speed of the moving arm approaches zero as a limit.

The use of an elastic system for recording the load transmitted eliminates the variables introduced by the inclination balance, provided the mechanical design is good, and it has the advantage of rapid and positive operation. Unfortunately, very little attention has been paid to the design of such machines and the variance introduced has caused them to be much in disfavor.

As the situation presents itself, there are two courses open for improvement and standardization of machines for testing textile materials:

¹American Society for Testing Materials. Report of Sub-Committee III of Committee D-13.

First, the standardization of existing machines, which practically means only one make, one capacity and the same dimensions of the same moving parts; otherwise there will still exist confusion of results caused by the testing of materials on machines having different machine characteristics.

Second, the redesign of the principle of the recording head of the testing machine, so that the results obtained are independent of the machine. The second consideration is practically as easy to effect as the first, and has the advantage of being based on sound mechanics.

It may be asked why the Bureau of Standards has recommended that a particular make and size of inclination balance testing machine be used by the military departments during the

present crisis. The military departments, such as the Quartermaster's Department and Signal Corps, were confronted with the problem of checking large deliveries immediately. Under these conditions the Bureau of Standards recommended one size of test specimen, one speed of operation, one make, and one capacity of inclination balance testing machine, regardless of whether any one condition of the test was fundamentally sound. The main object was to obtain uniform test methods at once.

For investigation work such as Committee D-13 contemplates, however, the testing machines used should be fundamentally correct.

The requirements of a testing machine are: (1) rigidity; (2) as nearly automatic operation as is possible; (3) recording head free from objectionable characteristics caused by (a) principle, (b) mechanical design.

The Bureau of Standards has been experimenting with a testing machine which as a whole has no value as a commercial machine, but which has shown itself to be reasonably constant and free from machine characteristics. It is constructed on the constant-increment-of-stretch principle and has a recording head of a suspended spiral spring and oil dash pot to take care of recoil. The head is illustrated in Fig. 3.

From the results obtained with this machine the Bureau is redesigning the present testing machines along these lines, with the addition of a temperature correcting device and an individual test result totalizer. The construction is rigid and simple, and the operation a little quicker and as automatic as that of any existing machines.

PROPOSED TENTATIVE SPECIFICATIONS FOR ADHESIVE INSULATING TAPE.¹

Issued, 1920.

1. THESE SPECIFICATIONS cover a friction tape composed of cotton sheeting impregnated with an adhesive insulating compound.

I. MANUFACTURE.

2. The cotton sheeting layer shall be made from a sheeting evenly and firmly woven from good cotton, and as free from unsightly defects, dirt, knots, lumps, and irregularities of twist as is consistent with the best manufacturing practice. The threads shall run in straight lines without waving, so as to reduce to a minimum the raveling of the cloth when cut into tape.

3. The frictioning compound shall be an adhesive and insulating compound practically free from free sulphur (not over 0.05 per cent) or other substances which would have a deteriorating effect on copper or other metals or on the fabric.

4. The fabric shall be thoroughly impregnated and evenly covered on both sides with the frictioning compound.

5. The thickness of the tape shall be not less than 0.013 nor more than 0.017-inch; when measured with a rubber spring micrometer with 0.4-inch diameter foot.

6. The compound shall adhere firmly to the fabric and shall not pull away from the fabric so as to leave bare spots when adjacent thicknesses of the tape are separated.

II. PHYSICAL PROPERTIES AND TESTS.

7. When the tape is held before a strong light, the number of pin holes noted per linear yard of tape, $\frac{3}{4}$ -inch wide, shall not exceed two.

8. The tensile strength per $\frac{3}{4}$ -inch width shall be not less than 30 pounds. The initial distance between the jaws of the testing machine shall be 12 inches, and the rate of separation of the jaws shall be 20 inches per minute.

9. When wrapped on a clean, smooth copper rod and baked at 100 degrees C. for 16 hours, the compound shall not discolor the copper.

10. (a) The adhesion of the friction coat of compound between the plies shall be such that when a strip of tape 2 feet long and $\frac{3}{4}$ -inch wide is taken from a roll and wound upon a 1-inch mandrel under tension of 7½ pounds at the rate of 30 inches per minute, a weight of 3 pounds shall not cause the plies to separate at a greater rate than 30 inches per minute.

(b) After a strip has been exposed to dry heat at 100 degrees C. for 18 hours and then cooled to room temperature, a test specimen shall withstand the test prescribed in the paragraph (a), except that the weight applied to unwind the tape shall be 1 pound instead of 3 pounds.

11. The test for dielectric strength shall be made as follows: The tape shall be spirally wound with one-third lap on a smooth metal rod, 1 inch in diameter, for a distance of 6 inches. Two inches in the center shall be covered with tin foil and bound down securely with tape, and an alternating potential of 1,000 volts, of a frequency of not over 65 cycles, shall be applied for five minutes between the metal rod and the tin foil without puncture.

12. One ½-pound roll for each 250 rolls shall be selected at random for the various tests. At least two feet of the outer layers shall be removed and one specimen taken for each test. If the tape fails in any one test, two additional specimens shall be taken. If the tape fails in either of these two additional tests, the material shall be rejected.

III. STANDARD WEIGHT, DIMENSIONS AND VARIATIONS.

13. The net weight of the tape, $\frac{3}{4}$ -inch wide, shall be not less than 8 ounces per roll, exclusive of core, wrapping, and box.

14. The length of $\frac{3}{4}$ -inch tape shall be not less than 55 yards per pound.

15. The width shall not vary from that specified more than ± 0.03 -inch.

IV. PACKING AND MARKING.

16. Each roll shall be wrapped in oiled paper or metal foil and enclosed in a suitable box. The wrapping shall be secure and shall thoroughly protect the contents.

17. Each box shall be marked with the name of the manufacturer or trade-mark, and the nominal width and weight of the tape.

V. INSPECTION.

18. The tape shall be tested and inspected within four weeks of date of delivery.

IN THE DUTCH EAST INDIES THERE ARE NOW ABOUT 12,000 motor cars. Practically all imported since 1915 are of American manufacture. Previous to that Italian and French cars predominated and manufacturers in both countries are trying hard to regain the Dutch East Indian market.

What the Rubber Chemists Are Doing.

THE DETERMINATION OF SUBSTITUTE IN RUBBER.¹

THE ACCURATE DETERMINATION of substitute in rubber articles is somewhat difficult. The method usually followed for an approximate test is as follows:

Part of the residue of the acetone extraction is heated for four hours in a flask with reflux condenser with 50 cc. of half-normal alcoholic potash solution. It is then filtered and the residue washed a few times with boiling alcohol and then with boiling water. Filtrate and washing liquid are evaporated to 15 cc., brought into a separating funnel, and after acidifying with hydrochloric acid, shaken with ether. The layer of ether is brought into a weighed flask, the ether is evaporated, the flask is dried at 100 degrees, and the increase of weight of the flask indicates the percentage of factis acids.

The determination takes place in the material previously extracted with acetone for reason that rubber resins are also partly saponifiable.² However, the substitute also dissolves partly in acetone, and this part varies for the different kinds of substitutes. The percentage found in the alcoholic potash extract is therefore too low for two reasons:

1. One part of the substitute is extracted with the acetone;
2. With the determination of the percentage of "factis acids" the real substitute is not actually expressed.

The second error is not to be avoided but can never be considerable. To correct the first one as much as possible it has been proposed to determine the other substances in the acetone extract, and to conclude therefrom what percentage of substitute is present in the acetone extract. The percentage of factis acids found as alcoholic potash extract increased by the percentage of substitute in the acetone extract, yields then the total substitute.

Although this method is in general use,³ a doubt arose when repeatedly using it as to the accuracy of its results. For that reason an investigation was decided upon and tests were carried out on a number of rubber mixings with substitute of which the composition was entirely known.

The rubber used was *Hevea* crêpe with an acetone extract of three per cent. As vulcanizing does not appreciably change the acetone extract, the percentage of substitute could be calculated in the acetone extract of the vulcanized samples, the percentage of free sulphur being known.

DETERMINATION OF SUBSTITUTE IN VULCANIZED RUBBER.

After previous extraction with acetone the alcoholic potash extract was determined in two grams of the acetone extracted material. The quantity of substitute in the acetone extract was calculated. The results are shown in the following table:

DETERMINATION OF SUBSTITUTE IN VULCANIZED RUBBER.

No.	Substitut. Add-in Per Cent.	Acetone Extract.	Free Sulphur.	Substitute in Acetone Extract.	Alcoholic Potash Extract.	Total Substitute in Per Cent. A + B.
1	10, brown	7.0	0	3.8	0.6	4.4

*The figures between parentheses were found in the mixes 7 to 13 after having been vulcanized for 3 hours.

†Sample very finely cut.

The figures in the third column indicate that the part of the substitute originally soluble in acetone retains this property after vulcanization. This is true if the samples are further vulcanized,

evident from the figures obtained from Nos. 7 to 13 having been treated for three hours (figures between parentheses).

The last column proves the important fact that in many cases the determination of substitute yields figures which, according to the method followed up to the present, are considerably too low.

No better results were obtained with stronger alcoholic potash solution. Normal solution, instead of half-normal, caused a sample with 10 per cent substitute to yield only 0.8 per cent alcoholic potash solution extract. A small improvement was noted on very finely cutting the samples, but even then the results were low.

The low results were due to inability of the alcoholic potash solution to penetrate completely the acetone extracted sample. It was demonstrated experimentally that extraction with half-normal alcoholic potash after suitable swelling of the sample, whether vulcanized or unvulcanized, in benzene gives satisfactory results provided the following precautions are observed.

1. Filtrate and washing liquid must be evaporated as far as possible. The reason for this has to be looked for in the fact that otherwise benzene is not sufficiently expelled and that therefore extraction with ether by shaking is not complete (compare results under A and B).
2. Benzene must be present in excess, giving too low results when this is not the case (compare under D); 1 to 6 contain mineral fillers and could suffice with 15 cc. benzene; 7 to 13, which do not contain any mineral fillers, require at least 20 cc. benzene (compare results under B and C).
3. The time of swelling also has some influence. It appeared to be desirable to let the rubber stand over one night with benzene (compare results under E).

DETAILS OF IMPROVED METHOD.

Two grams of acetone-extracted rubber is covered with 20 cc. benzene and left for one night; 40 cc. alcoholic potash solution, 0.5 N, is added and the liquid is boiled for about four hours with a reflux condenser on a water bath. It is then filtered and the residue washed with boiling alcohol and then with boiling water. Filtrate and washing liquids are evaporated nearly to dryness (3 to 5 cc.), rinsed into a separating funnel, and after acidifying with hydrochloric acid, extracted with ether by repeated shaking. The layer of ether is brought into a weighed flask, the ether is evaporated and the flask dried at 100 degrees Centigrade.

The author's investigation further demonstrated that the determination of substitute in compounds of rubber which contain asphalt is not feasible by the above method.

OXIDATION OF THE EXTRACTED RUBBER IN CONNECTION WITH THE DETERMINATION OF THE SUBSTITUTE.

Some observations were made in close connection with the above determinations of substitute which will be dealt with here. The acetone-extracted rubber kept in stoppered bottles appeared to be considerably altered after a few weeks. It is remarkable that only the vulcanized rubber changed considerably. The change is probably due to oxidation of the rubber. During a previous investigation on the non-saponifiability of resins⁴ it appeared that the oxidation products of rubber are soluble in acetone and saponifiable for the main part.

It was demonstrated that the presence of substitute does not influence this oxidation and from the analytic results it follows that the determination of the factis acids must take place directly after the acetone extraction.

¹By P. Dekker. "Communications of the Netherlands Government Institute for Advising the Rubber Trade and the Rubber Industry," Delft, Holland.

²"Communications of the Netherlands Government Institute," Part II (1917), page 59.

³W. A. Caspari, "India Rubber Laboratory Practice" (London, 1914), page 123; P. W. Hinrichsen and K. Memmler, "Der Kautschuk und seine Prüfung" (Leipzig, 1910), page 129.

Samples containing old ground rubber as a filler yield, after the second extraction with acetone, a considerable quantity of extract with alcoholic potash solution. It is to be expected that old rubber often will be present in more or less oxidized condition, for which due allowance must be made in interpreting the results.

METHODS OF ANALYSIS.

RAPID DETERMINATION OF GOLDEN ANTIMONY IN RUBBER GOODS.

THE FOLLOWING METHOD for the rapid determination of antimony sulphide (golden antimony) in rubber goods and reclaimed rubbers is that of W. C. Schmitz,¹ given as translated in the "Journal of the Society of Chemical Industry," April 30, 1920, page 307A.

Two grams of the material is heated with 45 cc. of sulphuric acid in a 300-cc. Kjeldahl flask for 20 minutes; the cooled solution is then treated with 3 grams of ammonium persulphate and gently re-heated for 10 to 15 minutes longer after it has become colorless. The cooled liquid is diluted, almost neutralized, with ammonia regardless of any precipitate, feebly acidified with hydrochloric acid, and then saturated with hydrogen sulphide. The precipitate is dissolved in hydrochloric acid containing tartaric acid, and the filtrate, after expulsion of the hydrogen sulphide is titrated with potassium bromate using methyl orange as indicator. If the original material contains no iron the precipitation can be omitted; the colorless solution in sulphuric acid is heated for 20 minutes with 5 grams of potassium sulphate; a little potassium metabisulphite is introduced and the sulphur dioxide expelled by boiling; after repeating this operation twice more the liquid is diluted with 40 cc. of water, and 10 cc. of hydrochloric acid and a considerable quantity of tartaric acid added; titration is then effected as in the earlier process. The whole estimation needs two to four hours.

GASOLINE DISTILLATION METHODS.²

1. If the electric heater is used it is started and allowed to operate a few minutes first to warm it.

2. The condenser box is filled with water containing a liberal proportion of cracked ice.

ELECTRIC GASOLINE DISTILLATOR.

3. The charge of gasoline is measured into the Engler flask from the 100 cc. graduate. This graduate is used as a receiver for distillates without any drying. This procedure eliminates errors due to incorrect scaling of graduates and also avoids the creation of an apparent distillation loss due to the impossibility of draining the gasoline entirely from the graduate.

4. The graduate is placed under the lower end of the condenser tube so that the latter extends downward below the top of the graduate at least one inch. The condenser tube is so bent that the tip can touch the wall of the graduate on the side adjacent to the condenser box. This detail permits distillates to run down the side of the graduate and avoids disturbance of the meniscus caused by the falling of drops. The graduate is moved

occasionally to permit the operator to ascertain that the speed of distillation is right, as indicated by the rate at which drops fall. The proper rate is from four cc. to five cc. per minute, which is approximately two drops a second. The top of the graduate is covered by a piece of fiber board, the condenser tube passing through an opening. This minimizes evaporation losses due to circulation of air through the graduate and also excludes any water that may drip down the outside of the condenser tube on account of condensation on the ice-cooled condenser box.

5. A boiling stone (a bit of unglazed porcelain or other porous material) is dropped into the gasoline in the Engler flask. The thermometer, equipped with a well-fitted cork and with its bulb covered with a thin film of absorbent cotton (preferably the long-fibered variety sold for surgical dressings), is fitted into the flask with the thermometer bulb just below the lower level of the side neck opening. The flask is connected with the condenser tube.

6. The electric heater is raised until the flask is in contact with the opening in the top and the gasoline brought to its boiling point. In case it is desired to record the initial boiling point, the thermometer is read when the first drop falls from the end of the condenser tube into the graduate. The amount of heat is then increased so that the distillation proceeds at a rate of from four cc. to five cc. per minute. The thermometer is read as each of the selected percentage marks is reached (20, 50 and 90). In case maximum boiling point or dry point (one definition of end point) is to be measured, the heating is continued after the flask bottom has boiled dry until the column of mercury reaches a maximum and then starts to recede consistently.

7. Distillation loss is determined as follows. The condenser tube is allowed to drain for at least five minutes after heat is shut off and a final reading taken of the quantity of distillate collected in the receiving graduate. The distillation flask is removed from the condenser and thoroughly cooled as soon as it can be handled. This can be accomplished by using first an air bath and then immersing the bulb of the flask in the ice-water mixture in the condenser trough. The condensed residue is poured into a small graduate or graduated test tube and its volume measured. This residue is retained for the acidity test. The sum of its volume and the volume collected in the receiving graduate, subtracted from 100 cc. gives the figure for distillation loss. In case this loss exceeds two per cent, a check distillation should be run to ascertain whether such loss is due to the presence of highly volatile constituents or to failure to condense the lighter fractions on account of too strong heating at the beginning of the distillation.

SWEET WAX.

Under the designation "Sweet Wax," a new compounding ingredient is being offered to rubber manufacturers. Its function is to render very smooth running a stock intended for delivery from a tubing machine, and in mold work to impart a highly polished finish to the article. The material also serves as a mild accelerator of vulcanization rather than as a retardant of the cure.

The material is a blend of hard, waxy hydrocarbons, neutral, of light gravity, and has a yellow to brownish color.

VULCANIZATION OF RUBBER BY MEANS OF ACCELERATORS.

J. L. B. Hasselt employs as accelerators combinations of nitro-sodium-ethylaniline with aromatic bases. These accelerators are said to be more active than either constituent alone. For example combinations of two molecules of nitro-sodium-ethylaniline may be used with one molecule of each of the following products: aniline, dimethylaniline, o-toluidine, p-phenylenediamine, x-naphthylamine.

The amount added to the rubber mixing is from 0.25 to 0.5 per cent. ("Le Caoutchouc et la Gutta Percha.")

¹"Gummi-Zeitung," 1918, 33, 23.

²According to the Bureau of Mines, Technical Paper No. 214.

CHEMICAL PATENTS.

THE UNITED STATES.

METHOD OF COLORING FIBROUS MATERIAL, which comprises subsection of the material to the action of a solution of cadmium chloride and that of a polysulphide of an alkaline earth metal; finally applying a vulcanizable plastic compound. (Charles H. Dennison, Wollaston, assignor to American Rubber Co., Boston—both in Massachusetts. United States patent No. 1,332,974.)

RECLAIMING AND REGENERATING RUBBER WASTE. The disintegrated material is subjected to the action of a heated liquid bath containing about 10 to 15 per cent by weight of caustic soda in water solution for approximately six to twenty hours at 50 to 200 pounds pressure per square inch. Subsequently the waste is treated by the action of a solvent mixture comprising the following materials in the approximate proportions by weight given: phenylenediamine, one part; paraffine oil, two parts; mineral rubber, two parts; rubber resin, two parts; acetic acid, two parts; subsequently the treated material is washed and dried. (Frank L. Kryder, Akron, Ohio. United States patent No. 1,340,777.)

CAN-SEALING COMPOSITION, comprising rubber dissolved in a volatile solvent and china wood oil. (Theodore Cramp Wester, Baltimore, Maryland. United States patent No. 1,341,489.)

SEALING COMPOSITION. A plastic composition comprising a rubber solution and gutta siak. (Theodore Cramp Wester, Baltimore, Maryland. United States patent No. 1,341,490.)

SOUND ABSORBING COATING. A composition of matter and article of manufacture consisting of rubber and volatile spirits. (Clarence H. Bryce, Glen Ridge, New Jersey, assignor to Benjamin Moore & Co., Brooklyn, New York. United States patent No. 1,341,704.)

THE UNITED KINGDOM.

ANTIMONY PIGMENT SUITABLE FOR VULCANIZATION is produced by decomposing a mixture of an antimony salt with alkali waste liquor by means of an excess of sulphuric or hydrochloric acid. Any proportion of the alkali waste liquor may be replaced by the product obtained by boiling time with sulphur. (E. F. Morris, Holly Bank, Roby, near Liverpool, England. British patent No. 138,137. Reference is also made to Specification No. 11,827/84.)

VULCANIZING RUBBER. Natural or synthetic rubber is vulcanized by the addition of salts of mono- or di-substituted dithiocarbamic acids and di- or tri-valent metals or inorganic radicals, and sulphur, the amount of sulphur being reduced to 2-0.2 per cent of the rubber. In an example, a mixing of 100 parts rubber, 0.5 parts sulphur, and one part paramethylene dithiocarbamate of zinc, with or without the addition of mineral oxides, reclaimed rubber, substitutes, and the like, is vulcanized in the usual manner. (G. Bruni, Milan, Italy. British patent 140,387.)

VULCANIZING RUBBER. The substances added as described in patent No. 140,387, namely, salts of mono- or di-substituted dithiocarbamic acids and di- or tri-valent metals or inorganic radicals, are added to mixings containing the usual proportion of sulphur, and the product is vulcanized at a lower temperature than usual, or at the usual temperature in a shorter time. In an example, a mixing of 100 parts of rubber, eight parts sulphur, one part pentamethylene dithiocarbamate of zinc, with or without fillers, is vulcanized in five minutes at a temperature of 120 degrees C., or in 45 minutes at 90 degrees C., or in a few days at air temperature. (G. Bruni, Milan, Italy. British patent No. 140,388.)

COMPOSITION FOR FILLING TIRES, consisting of soya bean oil 24 pounds, chloride of sulphur six pounds, oxide of magnesia 17½ ounces and venetian red three ounces. The ingredients are mixed and poured into a mold. When hard, the composition is placed in the tire casing as a substitute for air. (F. A. Hager, 441 Hawthorne avenue, Portland, Oregon, U. S. A. British patent No. 140,781.)

GERMANY.

PIPERIDINE PIPERIDYLDITHIOCARBAMATE, for use as a vulcanization catalyst, is prepared by the action of carbon bisulphide on an aqueous solution of piperidine at a low temperature; the presence of the water moderates the reaction. (Farbenfabriken, formerly Friederich Bayer & Co., Leverkusen, near Köln am Rhein. German patent No. 316,000, December 10, 1917.)

PROCESS FOR ACCELERATING VULCANIZATION of natural or artificial rubber-like substances. (Stanley John Peachey, Stockport, England. German patent No. 323,088, February 17, 1915.)

LABORATORY APPARATUS.
WICKER-WOUND WASH BOTTLES.

NEAT AND DURABLE wicker winding on the necks of flasks used as wash bottles is a welcome laboratory convenience when hot liquids must be handled. Wicking can also be applied to any glassware other than flasks or bottles, as convenience may require. (The Will Corporation, Rochester, New York.)

THE DAVON MICRO-TELESCOPE.

A patented English instrument for viewing objects is known as the "Davon" micro-telescope, shown in the illustration. The short focus type permits viewing specimens at a distance of from ten to 18 inches with magnification of from 15 to 38 diameters with large field and great depth of focus. A rod with a rubber foot is attached to the telescope so that the latter may be adjustably raised or lowered to the desired distance, the rubber foot serving as a non-slipping rest for the instrument. (F. Davidson & Co., 29 Great Portland street, London, W. 1, England.)

MICRO-TELESCOPE.

MERCURY SEALED ABSORPTION BULB.

The new Fleming patent mercury-sealed absorption bulb is automatically sealed when not in operation and has no inlet or outlet valves to turn off during the course of analysis. It eliminates errors because carbon dioxide or moisture will not escape even when the rate of flow of oxygen is as high as 600 per minute and there is no danger of trapping oxygen under pressure. The use of the new bulb reduces the number of weighings necessary and gives the analyst all the other advantages mentioned, in addition to those which have made the regular Fleming bulbs popular for carbon dioxide determinations by the combustion method. (Eimer & Amend, 211 Third avenue, New York City.)

MERCURY SEALED ABSORPTION BULB.

VITREOSIL BEAKERS.

One can evaporate, bake, and ignite in the same vitreosil beaker, since the negligible expansion of vitreosil over any range of temperature insures it against injury by the most severe heating, by quick water-cooling, or by the addition of cold acid to the hot utensil.

After evaporating an acid solution to dryness in a vitreosil beaker, the residue may be baked at the highest temperature available or strongly ignited over the blast lamp in the same beaker, without the least danger of breakage. (The Thermal Syndicate, Limited, 50 East 41st street, New York City.)

New Machines and Appliances.

HYDRAULIC LEAD-ENCASING PRESS.

RUBBER-HOSE MAKING requires various machines of special design but not one is more interesting than the machine that covers the uncured hose in continuous lengths with lead, that in reality is a mold which applies a plain, corrugated or ribbed, surface to the vulcanized hose.

The lead-encasing press here shown consists of a powerful hydraulic press of special design, driven by a hydraulic pump and controlled by special hydraulic

LEAD PRESS AND HYDRAULIC PUMP.

operating valves. These presses are usually made in two sizes, 650 tons and 1,000 tons capacity. The lead-encasing equipment comprises a lead-holding cylinder of alloy steel fitted with a wrought steel steam jacket and an oil-hardened and heat-treated alloy steel ram for forcing the lead downward through the cylinder. Located immediately below the lead cylinder is a block containing the lead-encasing dies and chambers through which the hose passes in a horizontal plane. There are several sizes of die blocks and dies for covering the ranges of hose from $\frac{3}{4}$ -inch to 3-inch outside diameter. There are other special devices in connection with the die block and dies for perfecting the lead-encasing operation. The press is set on a foundation so the floor is level with the top of the hydraulic cylinder and the reels for the uncovered and covered hose are placed on the floor at opposite sides of the press.

The operation is briefly as follows: the uncured hose is brought on a reel to the press, the cylinder of the press being charged with lead, the hydraulic pressure is applied and the lead covering is extruded through the die block in a horizontal direction. As the lead tubing moves outwardly, the end of the rubber hose is inserted into the opposite side of the die block and is lead-encased as the lead tubing is extruded. It is then wound on a special steel reel on the exit side of press. After the first charge of lead is exhausted, the cylinder is refilled and the process repeated whereby any length of hose can be encased without joints or seams. The reel of lead-encased hose is then placed in a vulcanizing oven and internal pressure applied to the hose during the vulcanizing process, after which the lead-encased hose passes through a stripping machine which removes the lead covering and the hose is ready for packing and shipping. (John Robertson & Co., 121-137 Water street, Brooklyn, New York.)

SOLID TIRE PRESS CRANES.

The labor-saving devices here pictured will interest tire fac-

tories, service stations, and garages, as one man can easily handle heavy truck wheels with these cranes. As the larger sizes of wheels consume most of the space between the two platens of the press, the cranes should operate in a very small space. Therefore they have been made exceptionally compact without impairing their strength. The hoisting mechanism is especially efficient, with automatic brake, and is built into the crane framework. All gears are machine cut from solid blanks.

The mast jib crane is arranged for attaching to the left-hand vertical column of the press. The boom occupies only 4 inches of space and swings over a large arc. When not in use it can be swung out of the way.

The monorail crane operates on an I-beam track attached to the top of the press in the center. It has four single-flange track wheels with hardened steel roller bearings, insuring free movement and long life. The boom requires only 4 inches of

MAST JIB TYPE.

MONORAIL TYPE.

ONE-TON TIRE PRESS CRANES.

head room. When not needed at the press, it can be moved out of the operator's way, or used independently as part of the track system. (The Chisholm-Moore Manufacturing Co., Cleveland, Ohio.)

A NEW SOLUTION MIXER.

A new and novel mixer for liquids, semi-liquids and soluble materials which is meeting with success in handling rubber cement and other compounds, is shown in the accompanying illustration.

THE TRIPLEX MIXER.

The portable type is made in three sizes, 10, 20 and 50 gallons capacity. The 10 and 20-gallon mixers are hand-portable and hand-operated. The 50-gallon mixers are wheel-portable and

motor-driven. The stationary type is made in 50 to 3,000 gallons capacity, and may be driven by motor or belt. (The Cleveland Mixer and Manufacturing Co., Cleveland, Ohio.)

TIRE CASING INSPECTING MACHINE.

The accompanying illustration shows a novel machine designed as an aid to the tire manufacturer, dealer, and repairman in discovering defects in the tire.

ROBERTSON'S TIRE INSPECTOR.

ing; and new tubes are easily inserted or old ones removed from stiff cord tires. (W. H. Robertson, 223 North Church street, Rockford, Illinois.)

MACHINE FOR CUTTING RUBBER WASHERS.

Rubber washers are now being cut accurately at a speed that heretofore has not been obtained commercially. The work is done on an automatic machine—here illustrated. It will cut

AUTOMATIC WASHER CUTTING LATHE.

washers having inside diameter ranging from $\frac{3}{8}$ to 5 inches, in widths varying from 1 $\frac{1}{2}$ -inch to $\frac{3}{4}$ -inch.

The cutting is done by a circular knife that is rotated by the stock and forced into it by the action of the cam. It is fed by a screw that is operated by a silent, smooth-acting cam. Variations in width are made by changing the feed-screw gears. This machine will take tubing 27 inches in length, having inside diameter of $\frac{7}{8}$ -inch and over; for lesser diameters than $\frac{7}{8}$ -inch it takes tubing 11 $\frac{1}{2}$ -inch in length. The short length tubing is re-

quired on account of the small size of the mandrel. (Black Rock Manufacturing Co., Bridgeport, Connecticut.)

RUBBER SOLVENT STORAGE SYSTEM.

A new system for distributing inflammable rubber solvents, such as petrol, naphtha, etc., has been devised, which is adaptable to any quantity from a small tank to a system provided with many drawoff points. It is worked by hydraulic power

which distributes the solvents automatically to any level at which the factory's water storage can be applied.

The storage tank is placed below the ground or at any convenient point for receiving the solvent from railroad or water carriage. A meter is arranged to measure the quantity run into the tank. Water from the main supply is let into the tank, when the oil or spirits rise to the top and any dirt or foreign matter sinks into the water. This accumulation is drawn off later when the tank is refilled with solvent.

BYWATER NAPHTHA STORAGE.

The naphtha flows through the connecting pipes to the point where a draw-off is needed in any part of the factory. A great saving is obtained in evaporation by this system, as the storage tank and the connecting pipes are kept full. Meters can be placed at any point, by which the supply can be gaged, and absolutely pure solvent can be drawn off without any risk of fire or loss. (Bywater & Co., 121 Kingsway, London, W. C. 2.)

SPECIAL SCALE FOR RUBBER COMPOUNDING.

Scales are of such importance in rubber compounding that special weighing devices have been designed for use in the compound room. The one here pictured is of the predetermined weight

type, having no graduations on the chart with the exception of a single reading line in the center. It has two beams, the lower one of ten pounds capacity, graduated in ounces, and the upper of two pounds capacity, graduated either in quarter ounces or one one-hundredth pounds, as the formula requires. Extra counterpoise weights are furnished so that the total capacity of the scale is 102 pounds, and it will handle all ingredients from lamp black to rubber.

COMPOUNDING SCALE.

The entire beam and counterpoise mechanism is encased in a dust-proof aluminum housing having three doors; the upper door covering the beams being equipped with a Yale lock, the right-hand door covering the counterpoise being so arranged that it cannot be opened except when the upper door is open, and the left-hand door opening into a compartment which may be used for the storage of weights. The scale is built upon the four-point principle of lever construction, is without check or stabilizing mechanism of any description, has agate bearings throughout, and is exceptionally sensitive and accurate. (Detroit Automatic Scale Co., Detroit, Michigan.)

MACHINERY PATENTS.

VARIABLE SPEED DRIVE FOR RUBBER MILLS.

THIS INVENTION relates to an improved method of driving the rolls of rubber mills, consisting, essentially, in driving the front rolls of a single mill or the front rolls of a series of mills, and the back roll of a single mill or the back rolls of a series of mills by two variable speed electric motors so that the speed ratio between the front and back rolls can be varied to any desired amount. (Frederick Iddon, Leyland, England, United States patent No. 1,342,114.)

STRIPPING DIPPED GOODS FROM CURING FORMS.

The illustration shows a perspective and plan view of the apparatus which is briefly described as follows:

Bracket *A* is attached to the edge of a bench or other suitable support arranged with a slot to receive the flanged end *B* of the form *C* carrying the object *D* to be removed by air inflation through the compressed air outlet *E*.

TOY BALLOON STRIPPING MACHINE.

The mode of operation is clearly shown in the lower illustration, where a pocket is formed by pressure of the operator's thumb and forefinger for the entrance of compressed air between the form and the rubber object, which is thus detached by slight inflation and easily stripped from the form. (William Gregg Lerch, assignor to The Miller Rubber Co., both of Akron, Ohio, United States patent No. 1,330,595.)

IMPROVED AIR BAG.

To avoid permanently stretching the air-bag through repeated use, a plurality of removable layers of fabric and rubber, preferably in the form of a series of sets of overlying or superimposed patches, are applied to the outer surface of the bag so as to approximately cover it. These patches are applied with cement after a preliminary dusting with soapstone so that while they will adhere sufficiently to enable the bag to be handled in the ordinary manner they are individually removable.

After the first tire is cured thereon an outer patch (or patches) is removed, thus decreasing the dimensions of the bag by a small amount, but sufficient to compensate for the permanent stretch of the bag. This process is repeated until all the layers or patches are removed, at the end of which time the bag has reached the

limit of its stretch. (Frank Fenton, assignor to The Miller Rubber Co., both of Akron, Ohio, United States patent No. 1,335,101.)

APPLYING REPAIR-TIRES TO WORN CASINGS.

Worn casings are repaired according to this invention by applying cement to one or both parts, allowing it to become tacky, applying the tread portion of the repair tire to the tread of the casing while in normal form, deforming the sides of the casing to increase their superficial area, and then rolling down the sides of the repair-tire while the casing is in its deformed condition. (Charles C. Gates, assignor to the Gates Rubber Co., both of Denver, Colorado, United States patent No. 1,341,121.)

- 503,099. Method for doing away with the chief cause of wear in pneumatic tires. J. Mallet and A. Capponi.

MOTION STUDY STOP-WATCH.

Stop-watches are not a new idea but the recent demand for greater production has made necessary more accurate and conveniently arranged stop-watches for industrial time study.

DECIMAL STOP-WATCH.

The stop-watch illustrated herewith is specially designed for industrial purposes and can be held in one hand while the other is free to write. The watch is started and stopped by a catch at the left of the stem, which is pushed in one direction to stop and another direction to start. If it is desired to bring the stop back to O the stem is pressed in. The large dial is divided, not into minutes and seconds, but into 100 parts to the minute. In other words, the division is a decimal one. This makes it easy to compute cost figures by multiplying the decimal fraction of a minute which is obtained directly from the watch. The small dial reads in minutes and runs to 30 minutes. This watch is a great convenience in making time studies and is far superior to those divided into fractions of seconds. (Educational Exhibition Co., 26 Custom House street, Providence, Rhode Island.)

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following district or cooperative offices. Requests for each address should be on a separate sheet, and state number.

(32,846.) A bicycle merchant in Bulgaria wishes to secure an agency for 20 to 100 bicycles, 100 to 1,000 bicycle tires, 100 to 1,000 inner tubes. Quotations c. i. f. Bourgas. Payment in leva. Correspondence in Bulgarian or French.

(32,873.) A firm in Czechoslovakia desires an agency for motorcycles, light cars and tires. Quotations c. i. f. Hamburg. Payment in currency or credit terms. Correspondence may be in English.

(32,905.) Commercial agent in Spain wishes agency for sale of balata belting. Quotations c. i. f. Spanish port. Correspondence in Spanish or French.

(32,908.) Representative of a firm in United States, sailing for Spain, desires agency for druggists' sundries in Spain and Portugal.

(32,910.) Retail drug company in Canada wishes to buy druggists' sundries. Quotations f. o. b. Canadian port.

(32,944.) A dental surgeon in Poland wants an agency for the sale of dental supplies, including rubber dam and rubber for vulcanizing. Quotations c. i. f. Danzig or f. o. b. New York. Correspondence may be in English.

(32,952.) Commission merchants in Poland wish exclusive agency for sale on commission of all kinds of rubber, in Poland and Lithuania. Quotations c. i. f. Danzig. Payment against documents after arrival of goods.

(32,953.) Cooperative association in Argentina wishes agency for sale of belting. Payment on arrival of goods in Argentina. Correspondence in Spanish.

(32,956.) Commercial agent in Australia wishes agency for sale of braces and men's garters.

(32,981.) American firm having connections with Australia and European countries desires an agency for the sale of rubber heels from manufacturers who can make up their wares for export under special labels.

(32,986.) A retail druggist wishes to buy and to secure an agency for druggists' sundries. Quotations f. o. b. Canadian port.

(33,004.) American representative of firm in Colombia wishes agency for sale of elastic webbing.

(33,005.) Commercial agent in Switzerland desires agency for sale of india rubber. Quotations French or Belgian port. Correspondence may be in English.

(33,012.) Manufacturers' agent in Australia desires direct representation of manufacturers of druggists' rubber goods.

(33,029.) A firm in Mexico wishes an agency for sale of tennis shoes with rubber soles, which are very popular for everyday wear. Quotations f. o. b. western ports. Correspondence may be in English.

(33,035.) A firm in India desires an agency for the sale of surgical, dental, and rubber goods.

(33,039.) An importer in the Maltese islands wishes an agency for rubber tires for motor cars and cycles. Payment against documents in local banks.

(33,047.) Importing company in South Africa desires agency for sale of rubber goods and surgical appliances.

(33,065.) A commercial association in Italy desires to secure an agency for the sale of prime materials for rubber factories. Quotations c. i. f. Genoa. Payment in United States currency. Correspondence may be in English.

(33,089.) The administration of a city in Austria wishes to make contracts for a supply of solid and pneumatic tires for 150 automobile trucks, 80 passenger automobiles, and 25 omnibuses, to be delivered as they are needed.

RUBBER SCRAP DIVISION MEETS.

A meeting of the Scrap Rubber Division of the National Association of Waste Material Dealers, Inc., was held at the Hotel Astor, New York City, on Wednesday morning, June 16, with Nat E. Berzen presiding. A special committee consisting of H. H. Cummings, Herman Muehlstein, and J. W. Long was appointed to deal with changes in the Scrap Rubber circular. Other matters discussed were of a routine nature.

THE PONY BLIMP, A ONE-MAN DIRIGIBLE MANUFACTURED BY THE Goodyear Tire & Rubber Co., has been placed upon the market and the United States Government was one of the first purchasers. Contracts were recently closed for two by government officials in Akron.

New Goods and Specialties.

THE "BROWNFOOT" RUBBER BOOT.

A HANDSOME RUBBER BOOT comes to us from Canada. It has a brown foot, with sole and heel of the same color, and a white top trimmed with brown top bead. The trade mark on the side, near the top, is also brown. The boot is made of high-grade white and brown rubber and is lined with duck. It comes in three heights, styled, variously, hip, "Storm King" (thigh), and short, for men. The sole is knurled and the brown foot has a fancy tab effect at back and front, reaching some distance upward on the white leg part.

THE "BROWNFOOT."

A very similar boot called the "Grayling" is made by the same manufacturer. It is chiefly of gray rubber and instead of having the foot of contrasting color, has the white foxing at the edge above the sole. It is made of extra quality rubber and is friction lined. This boot comes in the same heights for men as the "Brownfoot," and also in short length for boys. (Gutta Percha & Rubber, Limited, 47 Yonge street, Toronto, Ontario, Canada.)

NEW SINGLE SOLID TIRE.

The newest single solid tire attempts to overcome the chief cause of internal friction and dissipate the frictional heat generated by traction by means of deep depressions with cross-bars of rubber between, at regular intervals around the circumference of the tire. The depressions go deep enough to reach below the point where a tire is ordinarily worn to the limit of its serviceability, the tire thereby retaining its distinctive qualities without requiring additional attention such as regrooving, etc. At the same time the shape of the depressions is such that stones and other foreign bodies cannot permanently lodge within them. (United States Tire Co., New York City.)

THE "MONOTWIN" TIRE.

AN INNER TUBE FOR CORD TIRES.

In order to use inside a cord tire the ordinary inner tube which was designed to fit a fabric tire, it must be inflated far beyond what was intended to be its normal point of stretching. This tends to weaken the wall, both because of overstretching and of increased friction.

THE "HORSE-SHOE RE-CORD" INNER TUBE.

The accompanying diagram in cross-section illustrates the additional amount of space to be filled by the inner tube in a cord tire, as compared with that within a fabric tire. The black arrow indicates the cross-section

of a five-inch fabric tire and the white arrow the cross-section of a cord tire.

The "Horse-Shoe Re-Cord" inner tube has been designed purposely to meet these conditions. Its wall is thicker than that of the ordinary inner tube, because it is composed of nine plies of high-grade laminated rubber instead of the more usual six. Its name is intended to emphasize its greater ability to meet the required conditions. This inner tube is brown. (Racine Auto Tire Co., Racine, Wisconsin.)

TENNIS RACKET COVER.

A rubber sheath to cover tennis rackets is something that should appeal to all those who take pride in keeping their sporting equipment in prime condition. This sheath is in two parts, each having an appearance similar to that of a bathing cap, except that the portion that fits over the lower part of the racket has an opening to permit the passage of the handle. The handle is gripped firmly by the rubber, the upper portion of which overlaps the lower, providing an entirely waterproof covering. The regular tennis case may be used over the rubber one if additional protection is desired or should be requisite.

TAYLOR TENNIS SHEATH.

PATENTED REPAIR KIT.

A handy repair kit that comes put up in a neat box is intended for use in mending footballs, baseballs, bladders for game balls, and other rubber articles. It has been officially approved by the Board of Education of the City of New York and is particularly recommended by the manufacturer for practical use in gymnasiums, colleges, schools and camps. The box is convenient in size, namely, 7 by 9 by 3 inches, and contains the necessary tools and materials, including a special patented device for the emergency repair of necks of bladders. The tennis racket sheath and repair kit are put out by the same house. (Alex Taylor & Co., Inc., 26 East 42d street, New York City.)

(Patented April 22, 1920.)

ENGLISH SOLE-PADS.

From England come the "Double Arch" sole and heel pads in sizes to fit all boots. They are interchangeable and may be arranged in six different ways. The rubber pads are attached by leather disks which, it is claimed, insure a perfect fastening to the boot. This idea is registered in the patent office of the United Kingdom. (J. P. Cochrane & Co., Albert street, Edinburgh, and 29 Farringdon street, London, E. C. 4.)

"DOUBLE ARCH" PADS.

MOLDED RUBBER FISH LURES.

A line of cleverly simulated insects has been developed in molded rubber for the purpose of deceiving the wily fish into biting at the hooks these ingenious lures conceal. The entire line comprises ten numbers, including representations of the crawfish, two sizes of helgramite with bucktail, a medium and a small-sized helgramite, four sizes of cricket ranging from the extra small to the large, three sizes of grasshopper, and a large crawfish and helgramite. The articles are all extremely lifelike. The illustration shows three numbers of the line, all of which are artfully molded in soft rubber. (W. J. Grube, Delaware, Ohio.)

HELGAMITE

GRASSHOPPER

CRICKET

FOUR-HOLE BAGPIPE BALLOONS.

Toy manufacturers are busy these days and the time for fairs, summer fêtes, and other occasions when Young America delights in anything that will produce a noise, offer opportunity. Two ingenious balloons of the squawker type, modified to produce notes which sound like a bagpipe, are shown here. The mouth-

"EAGLE BRAND" BAGPIPES.

pieces are shellaced and the lower one is so constructed that, when released from the mouth, all air that has passed into the bag will pass out through the tone pipe. The bags are of high-grade red rubber and of sufficient weight to permit excess inflation and moderately rough usage. (The Eagle Rubber Co., Ashland, Ohio.)

INNER TUBE THAT MINIMIZES BLOW-OUTS.

A new pneumatic inner tube is so molded under compression

THE "CLIMAX" INNER TUBE.

that several hundred small depressions or pockets are geometrically distributed over the portion which comes next to the casing. If the tube is punctured, the excess rubber in these compressed portions immediately expands to prevent the escape of the air within. (The Climax Rubber Co., Columbus, Ohio.)

"SAFETY FIRST PULL-OVER" GLOVE.

A glove that is made to meet the demand for toughness without bulk, service without clemency, and wear-resistance where the wear comes hardest, is embodied in the one shown in the

accompanying illustration. It is made of light-weight "stay soft" horseshide that is tough but entirely flexible and will, it is claimed, remain soft and pliable in spite of wetting. It has a sewed-out-
scam and because of its construction and size can be easily pulled over any rubber glove. This is an especially desirable feature, as many gloves cannot be so used. (O. C. Hansen Manufacturing Co., Milwaukee, Wisconsin.)

"SAFETY FIRST PULL-OVER" GLOVE.

RUBBER RETAINER FOR BATTERIES.

In service, the positive plates of a battery tend to shed their active material, and as far as this takes place the battery wears out. One battery manufacturer has devised a slotted retainer made of hard rubber in a tough, thin sheet which is placed against the active material on each side of each positive plate. The slots are sufficiently nu-

"PHILCO" SLOTTED BATTERY RETAINER.

merous to permit the free passage of acid and current but so narrow as to make the retainer practically a solid wall to hold the active material firmly in place. A special machine is employed to manufacture the "Philco" slotted retainer, because hard rubber is not easily cut and any tool used for the purpose tends to dull or break very quickly. It took five years to perfect this machine, developing it from the first crude model to the effi-

ACHILLES TIRES.

This is the "day" of the tire manufacturer and each new company, however like or unlike other tires its product may be in actual construction, must identify its product to the public by an individual distinctive tread design. The design on the left, called the "Butterfly," is that of an oversized, high-grade pneumatic tire, made with an extra ply of fabric. The one on the right is the "Reindeer," a lower-grade pneumatic tire, made under special brands for large distributors. (The Achilles Rubber and Tire Co., Inc., Binghamton, New York.)

ACHILLES "BUTTERFLY" AND "REINDEER" TIRES.

A PRACTICAL MAT FOR THE RUNNING BOARD.

A mat of attractive pattern, imitating diamond-shaped tiling blocks, is the "Motomat," intended for automobile running boards. It is made of the same kind of stock used in the rubber mats put on the steps of Pullman cars and is easily cleaned with a

whisk broom or stiff brush. The "Motomat" may be attached to a wooden running board by means of nails passed through the metal disks in the corners or by substituting small screws for the nails and using a quick-drying rubber cement to fasten the mat permanently in place. If the running board is of metal, the mat may be attached by means of flat-head stone bolts with lock washers. The "Motomat" is made in one size only—7½ by 11¼ by 3/16 inches.

THE "MOTOMAT."

A SEMI-CIRCULAR CUT-OUT RUBBER MAT.
The modern dentist or barber can now complete the entire sanitary equipment of his place of business by adding the "Circomat."

This is a semi-circular rubber mat, made of a good quality of rubber stock with a canvas backing, and having a corrugated surface so designed that the corrugations run outward from the center to make it easy to clean. The outer edge is beveled so that the mat need not be taken up each time the room is swept or cleaned. The "Circomat" is made in several thicknesses, but the ¾-inch is particularly recommended, as this will lie on the floor without buckling. The central portion of the mat is cut away in a semi-circle varying from 17 to 24 inches in diameter, to fit the pedestal of a barber or dental chair, and the outside diameter is 72 inches. The "Circomat" is made in solid colors only—black, white, gray, red, or green.

THE "CIRCOMAT."

Both the "Motomat" and the "Circomat" are products of the same manufacturer. (United States Rubber Co., New York City.)

RUBBERIZED COTTON GLOVES.

The "Wearflex" cotton gloves, reinforced in one style by being rubberized and in another by the application of rubber and rubberized fabric inside the palm and fingers, provides for various classes of workers an inexpensive, comfortable glove that will outwear a glove made of cotton alone. The palm-faced glove is designed especially to meet the demand for a suitable glove to wear in factories and is unusually flexible for a glove that will wear as well. These gloves are desirable for use by farmers, firemen, masons, miners, molders, plumbers, steam fitters, iron workers, mill men, excavators, etc. (The McAdams-Akron Co., Akron, Ohio.)

"WEARFLEX" GLOVE.

THE BURKE "GRAND PRIZE" GOLF BALL.

The "Grand Prize" golf ball is the result of three years of experimentation on the part of the manufacturers, and is said to be true in flight and remarkable for distance. The core and cover have been developed according to special formulas and are

designed to withstand hard usage. (Burke Golf Co., Newark, Ohio.)

THE "JAYHAWK" GOLF BALL.

Another new golf ball with a covering of white gutta percha has been added to the season's offerings in this line. It has the dimple recessed marking and is enameled with a special gloss finish. It comes in two sizes, 29 and 31 pennyweights. (Schmelzer Arms Co., Kansas City, Missouri.)

INGENIOUS VALVE SHUT-OFF FOR SYRINGES.

An invention which dispenses with the usual metal clip comprises a fountain-syringe valve seat and valve of rubber, located near the juncture of tube and pipe, operated with one hand by rocking the parts against the elasticity of the conduit which en-

RUBBER VALVE AND SHUT-OFF FOR SYRINGES.

closes and holds the parts in alignment. The valve closes instantly on release. (Patent applied for by H. H. McGee. Good-year's India Rubber Glove Manufacturing Co., Naugatuck, Conn.)

THE "FLEX-O-TYTE" FAN BELT.

A fan belt for Ford cars is composed of two thicknesses of bias-woven rubber-coated fabric, wrapped, cured, and cemented together. It is claimed by the manufacturer that this fan belt is proof against heat, water, and oil, and that it will not stretch. (A. J. Stephens Rubber Co., Kansas City, Missouri.)

INDIVIDUAL TUB FOR INFANTS.

Baby can now have the luxury of his own private bath tub, wherever he is.

It is made of extra heavy canvas duck, without seams, double coated with white rubber, and is guaranteed by the manufacturer against leaking. There is an outlet faucet of hard rubber at the bottom of the tub and attached at one end are rubber pockets for toilet articles. The frame, which can be folded up compactly, is made of wood in either the natural or white enamel finish. A patented clutch at the crossing of the legs prevents undue tension and stretching of the rubberized canvas of which the tub is composed. The towel bar is covered with white rubber tubing. (New York Bath Manufacturing Company, 103 Chambers street, New York City.)

INFANT TUBING PATENTED.

Activities of The Rubber Association of America.

ANNUAL SUMMER OUTING.

PREPARATION is being made for the annual summer outing of The Rubber Association of America, which will, if at all possible, be held during the week of July 25, probably Wednesday, the 28th, but the date and the location cannot yet be definitely announced, due to the unavoidable delay in the selection of an appropriate place. Consideration has been given to the Seaview Golf Club at Absecon, New Jersey, which was the location of the 1919 outing, but it is hoped that arrangements may be made for the outing to be held at an equally satisfactory place nearer New York and consequently more convenient to members in New England and in the Middle West. Definite information will be supplied to all members at the earliest possible moment concerning the details of the arrangements.

MEETINGS.

EXECUTIVE COMMITTEE, TIRE MANUFACTURERS' DIVISION.

The June regular meeting of the Executive Committee, Tire Manufacturers' Division, was held at the offices of The Rubber Association on June 16, and a considerable number of matters of a routine nature were given attention. Principal in interest was the subject of determining recommended minimum and maximum cross-section widths for pneumatic tires, as to which it was not found possible to reach a final understanding and the matter is still before the Committee.

EXECUTIVE COMMITTEE, MECHANICAL RUBBER GOODS MANUFACTURERS' DIVISION.

The Executive Committee, Mechanical Goods Division, held its June regular meeting at the Yale Club on Thursday, June 24, at which time several subjects of considerable interest were given attention, but none of the matters have progressed to the point at which definite advice may be promulgated.

SPECIFICATION COMMITTEE, MECHANICAL RUBBER GOODS MANUFACTURERS' DIVISION.

For the convenience of several members of the Specification Committee who wished to attend the convention of The American Society for Testing Materials at the New Monterey Hotel, Asbury Park, the June meeting of the Specification Committee was held at that place on June 23 and 24. As has become the habit of this Committee, a large docket of subjects was disposed of and substantial progress was made in the working out of the detail connected with the Committee's work in the direction of improving and standardizing specifications for mechanical rubber goods.

INDUSTRIAL RELATIONS EXECUTIVE COMMITTEE.

The Industrial Relations Executive Committee met at Boston, June 10, 11 and 12, at the invitation of the Hood Rubber Co., and very satisfactory progress was made on the development of several subjects now before the Committee, definite advice concerning which will be disseminated from time to time through the medium of circular letters and bulletins as the work on any subject is completed.

BULLETINS.

The bulletins issued frequently during the past month by the Association for the benefit of its members contained the following information of trade interest.

It appears from the conclusion reached by the Research Staff of the National Industrial Conference Board on the length of the work week, in its study of the hours of work problem in five major industries, that no single schedule of hours is equally adaptable for all industries from the standpoint of production. The evidence is overwhelming that maximum efficiency cannot be obtained in all industries with any single specific work-day. In general, the ability to increase hourly efficiency and thus make up, either wholly or in part, for reductions in hours is largely determined by the amount of

handwork, as distinguished from automatic machine work, which is performed in any given process.

With regard to medical supervision in industry, the cost is not large, and the benefits derived far outmeasure the expenditure. A compilation of data submitted by forty-one industrial establishments with an aggregate of 223,416 employees showed that in 1915 the average annual cost per employee was \$1.88. A later study covering the year 1916 and including ninety-five industrial establishments with a total of 479,634 persons indicated an average annual cost of \$2.21 for each person employed.

A prominent construction company, employing several thousand men and operating in the New England and Middle Atlantic States, has for some time been making an interesting experiment in educating its employees regarding labor costs. Recognizing the value to its executive of graphs and diagrams as aids to effective visualization of the status of work on the various jobs upon which the company is engaged, the practice of preparing charts for the foremen and workmen was recently adopted. These charts are plotted week by week and show the unit costs of each class of work, as, for example, excavation, making up forms, erecting forms, placing reinforcement, pouring concrete, etc. In order to be available without difficulty the charts are posted in a weatherproof case on the outside of the field office.

HOURS IN RUBBER WORK-WEEK.

The following tabulation was compiled from the responses of 187 rubber manufacturers:

A NEW PRINCIPLE FOR WAGE INCREASES.

The Industrial Court in Great Britain in a recent decision lays down a new principle for determining claims for wage increases. Hitherto the awards of the Committee on Production, and subsequently of the Interim Court of Arbitration, have been accepted as standard; these provided for wage increases commensurate with cost of living increases. The decisions, as a rule, provided also for rehearings every four months, so that if the cost of living were found to have increased, an equivalent wage increase might be considered.

In its decision the Industrial Court states that no increase in wages is due as a result of increases in cost of living, but that the value of the work done must be the determining factor. The Court holds that: "The remuneration of the various classes of workpeople should, in ordinary circumstances, depend on the value of the work done, and the value of the work done depends upon the state of the market and the demand for the products of the workshop."

CANADIAN PARCEL POST REGULATIONS.

According to the customs regulations of Canada no goods exported to that country from the United States, whether sent by mail or otherwise, can be entered through the Canadian customs without certified invoices furnished by the exporter to the importer or his agent. The certified invoices must be furnished in triplicate, two copies being required for customs entry and the third for the use of the importer. The proper commercial designation of the goods must be set forth in all invoices. The invoices must show the marks and numbers on the packages, in such a manner as to indicate truly the quantities and values of the articles comprised in each package. Every invoice must contain a sufficient description of the goods, and in respect of goods sold by the exporter must show in one column the actual price at which the articles have been sold to the importer and in a separate column the fair market value of each article as sold for home consumption in the country of export. The "price" and "value" of the goods are to be stated as in condition packed ready for shipment at the time when and at the place whence the goods have been exported directly to Canada. But when the value of goods for duty purposes is determined by the Minister of Customs, the value so determined will be held to be the fair market value. The fact that packages of merchandise from the United States for Canada may be accompanied by customs declarations does not obviate the necessity for certified invoices being furnished by the exporter to the Canadian importer for use in making customs entry of the merchandise.

NEW TRADE PUBLICATIONS.

THE WELLMAN-SEEVER-MORGAN CO., CLEVELAND, OHIO, ISSUES a series of beautifully illustrated and remarkably clear "Bulletins," of which No. 48 deals with "Rubber Machinery." These bulletins show on one page a half-tone picture of a machine or installation, and on the page opposite a working blue-print giving the mechanical details. The rubber machinery includes the following: tire-applying press, rubber cracker and washer, rubber mixing mill, calender, rimming press, and hydraulic press vulcanizer. Other bulletins describe coal and ore handling machines, cranes, hydraulic turbines, hoisting and coke-oven machinery, and steel works and port and terminal equipment.

THE ALTENBURG TIRE EQUIPMENT CO., DAVENPORT, IOWA, AND Columbus, Ohio, issues an extremely useful catalog of its products for the year 1920. The first half contains distinct pictures with detailed descriptions of all the machinery and tools used in tire repairing, while the last half conveys in clear language practical instruction, helped with many illustrations, in the modern methods of tire repairing.

"MILLER TIRE TRADE NEWS," THE HOUSE ORGAN OF THE MILLER Rubber Co., Akron, Ohio, makes its first appearance with the June number. It is a lively little sheet, giving a lot of information about rubber, besides news of the company's activities that interests the general public as well as the employees.

"CONVERSE FOLKS," THE OFFICIAL FACTORY MAGAZINE OF THE Converse Rubber Shoe Co., Malden, Massachusetts, to replace the "Triple Tread News," made its initial appearance June 1, 1920. It is to be published twice a month by a staff of Converse employees under the editorship of W. Sewall, and printed in the

company's own printing plant. The first issue is a 40-page, well-illustrated paper of pocket size with a two-color cover. It contains much interesting factory news and many breezy personals, all well calculated to foster a feeling of cooperation, friendship, and loyalty throughout the Converse organization.

"THE WIGWAM," THE HOUSE PUBLICATION OF THE SPRECKELS "Savage" Tire Co., San Diego, California, is printed in Indian red, on cream-colored stock. Some of the departments are: "In Counsel with the Big Chief," "Factory Pow-Wow," "Squaw Squawks," "Savage Sports," "Many-Ha-Ha-Heap-Big Smileage Section," etc. The head of an Indian chief and a wigwam decorate the title-box on the front page.

THE COOPER-HENITT ELECTRIC CO., HOBOKEN, NEW JERSEY, issues an artistic and expensive "Portfolio of Industrial Illumination," a large quarto pamphlet with 19 handsome illustrations, showing the light in operation in factory interiors. These include machine tool factories, motor works and cotton mills. The cover has a striking picture of the exterior of a mill lighted at night with the lights reflected in the waters of an adjacent pond.

THE NORTHERN RUBBER CO., LIMITED, GUELPH, ONTARIO, SENDS out its 1920-1921 catalog of "Partridge Rubber Footwear," profusely illustrated in color, showing its many lines of boots and shoes for lumbermen and fishermen, for sports and for city wear.

"RUBBER," A HANDY LITTLE MAGAZINE OF BOILED-DOWN INFORMATION on rubber engineering and production, edited by Thomas P. Hallock and Charles C. Lynde (The Trade Press Co., Cleveland, Ohio), in the May number has an illustrated article by Mr. Lynde on overhead handling of tire molds, followed by other articles of rubber interest.

"THE STRONGHOLD," THE NEW MONTHLY PUBLICATION OF THE Rubber Products Co., Barberton, Ohio, is given over chiefly to factory news and to matters of interest to the employees. It contains some clever verse.

IN THE APRIL ISSUE OF THE "COLOR TRADE JOURNAL" APPEARS AN article by Frederic Danneneth, Ph. D., entitled "Coal-Tar Products Used in Rubber Industry." Dr. Danneneth lists eleven different coal-tar products used in rubber manufacture, and then discusses at some length the following topics: Formation of colored diazo compounds in rubber mixings; thinners for rubber compounds; porosity correctives; a coagulant for rubber latex; accelerators of vulcanization; industrial research on accelerators; influence of amino accelerators on health; devulcanizing agents; reclaiming waste rubber; black pigment for coloring compounds, and softening waste rubber.

"PRIMROSE," EDITED BY P. CAREL WIJNAND, THE FIRST RUBBER periodical in Holland, bids farewell to its readers in the mid-April number, as it is obliged to suspend publication on account of the increased demands of compositors and printers for higher wages, as well as because of the high prices for paper and other materials. It has been a valuable, original, and artistic paper in the seven years of its existence.

THE *Internationale Vereniging voor de Rubber-Cultuur in Nederlandsch-Indië* (International Association for Rubber Growing in the Dutch East Indies), of Amsterdam, issues its sixth yearly report, for 1919, in Dutch and in English. Besides describing the activities of the society, the report discusses the labor difficulties in Java and Sumatra and the proposed export duty on rubber, and gives some interesting statistics on rubber production.

THE EDITOR'S BOOK TABLE.

"THE PREPARATION AND VULCANIZATION OF PLANTATION Pará Rubber." (D. Van Nostrand Co., 25 Park Place, New York City.)

THIS encyclopedic collection of articles on rubber by B. J. Eaton, J. Grantham and F. W. Day, the practical chemists of the Agricultural Department of the Federated Malay States, is

becoming hard to get, as its value has been recognized by rubber men everywhere. The book was reviewed in *THE INDIA RUBBER WORLD* February 1, 1919; the substance of the information it contains has been noted in these columns as the articles first appeared.

CANADIAN TRADE INDEX, 1920-1921. (THE CANADIAN MANUFACTURERS' ASSOCIATION, Inc., Toronto, Canada.) (Cloth, large octavo, 10½ by 7 inches, 832 pages and map.)

This trade index, the only one of its kind for Canada, is divided into three parts, and in a limited number of copies into four. First comes an alphabetical list, giving the name and address of every manufacturer in the Dominion and comprising 9,500 firms. Next comes the classified list of Canadian manufactures, comprising 8,445 items, with the names of the manufacturers. Following is the list in the French language of all these manufactured articles, with references to the number under which the English information and the manufacturers' names appear. In the limited edition a similar list in Spanish follows the French catalog. An excellent, official map of the Dominion of Canada, showing the transportation facilities, the trade routes and the natural resources of the various districts, is enclosed. The index is indispensable to those who desire Canadian business.

INTERESTING LETTERS FROM OUR READERS. EAST AFRICAN RUBBER POSSIBILITIES.

TO THE EDITOR:

DEAR SIR:—At the present time, when there is such a large demand for rubber goods, it becomes a matter of paramount importance for those concerns engaged in the rubber industry to endeavor to obtain sufficient supplies of raw material in order to cope with the increasing demand for manufactured rubber goods.

The writer, who campaigned in German East Africa with a British native regiment, is of the opinion that the former German colony would make a valuable addition to the existing sources of crude rubber obtainable by American manufacturers. Already the vacated rubber plantations of former German owners have been taken up by other planters, and as the mandate given to Great Britain to govern this territory should not affect the "open door" policy in regard to trade and commerce with other countries, it should furnish the American rubber industry with the opportunity to tap these new resources and further increase the supply of crude material.

It was further noticed that a large amount of rubber was growing in Portuguese East Africa, especially in the Lugella district, where exceptionally large tracts were under rubber cultivation and which it is believed were owned by the Lugella Company. Large areas under rubber cultivation were also observed while passing through the territory administered by the Mozambique Company. Native labor is abundant and the cost on the plantations is of negligible importance, as in many cases natives are paid in calico and food.

The writer, who is not connected with the rubber industry in any way, is merely stating what he has seen in East Africa and would be satisfied if his observations may prove of more than passing interest to rubber manufacturers and possibly worthy of investigation. It would undoubtedly be a sound project for American manufacturers to get in touch with new planters in East Africa, more especially in the vast territory formerly known as German East Africa, and aggressive efforts ought to be made to obtain a portion of the rubber crops of that country as soon as they become ready for marketing.

JOHN NELSON,

Ex-Sergeant, King's African Rifles.

Holyoke, Massachusetts.

IN MEMORY OF A GREAT FRENCH AVIATOR.

TO THE EDITOR:

DEAR SIR: It is a year ago that the famous aviator, Jules Védérines, met his death in trying to accomplish his first voyage by airplane from Paris to Rome. He was popular throughout the world for his audacity, courage, and his exceptional qualities, and he was one of the most active and best mechanics in the victory of the air.

Jules Védérines has left his old mother, aged 71, his widow, and four children aged 10, 8, 7, and 5, and it is for their help that a committee has been formed which is patronized by members of the French Government and the notability of all the large nations, in order to provide for the needs of the family and to erect a monument in the place from which the celebrated aviator started his tragic flight.

The headquarters of the committee for subscriptions to the monument of Jules Védérines, is at 93 boulevard Beaumarchais, Paris. The subscriptions are to be addressed to the treasurer, Monsieur Georges Labastie, 7 Place de la Bastille (Paris IV-), France.

COMITÉ DE SOUSCRIPTION AU MONUMENT À LA
MÉMOIRE DE L'AVIATEUR JULES VÉDERINES.

THE OBITUARY RECORD.

FOUNDERS OF THE MCGRAW TIRE & RUBBER CO.

EDWIN C. MCGRAW, founder and for ten years president of The McGraw Tire & Rubber Co. of Cleveland and East Palestine, Ohio, died at his southern home, Point View, Miami, Florida,

on May 24, after an illness of several months. Mr. McGraw was born in Pittsburgh, Pennsylvania, in 1858, and became a member of the firm of J. A. McGraw Brothers, who were pioneers in the rubber roofing business, at the age of 23, engaging in brick making and the real estate and hotel business.

EDWIN C. MCGRAW.

In 1908 he secured the patent rights in the "vertical fabric thread tire," and in the following year decided to build a tire plant at East Palestine. This started by making eight tires a day; by 1919 its output was 5,000 tires and 6,000 tubes daily. It now manufactures only high grade tires, the McGraw fabric, cord and solid tires with the 5,000 mile guaranty. Mr. McGraw was also president of the Fidelity Trust & Mortgage Co. and a director of the Fidelity Bank and Trust Co. of Miami. He leaves his widow, a son, R. W. McGraw, and a daughter, Mrs. John Morgan, and also one brother, G. W. McGraw, Jr.

ERECTING ENGINEER FOR HUNTER DRY KILN CO.

Robert L. Monroe, erecting engineer for The Hunter Dry Kiln Co., Indianapolis, Indiana, died suddenly of heart disease Saturday, June 19, 1920, at his home in Indianapolis. Mr. Monroe became associated with the Hunter Dry Kiln Company shortly after its incorporation and, acting in the capacity of erecting engineer, had occasion to visit many of the well-known rubber

factories where he made numerous warm friends who appreciated his trustworthiness and strong personality. Mr. Monroe was thirty-seven years of age. His widow and four children survive him.

WAS NOT A CHRONOLOGICAL REFERENCE.

Our good friend, the learned editor of the "*Bulletin de l'Association des Planteurs de Caoutchouc*," thus comments upon a recent article:

"The very distinguished director of The India Rubber World, Mr. Henry C. Pearson, in telling the history of plantation rubber in the December number of that review writes: 'When the automobile industry entered on its glorious career, the demand for rubber was such that it rose from its normal price of \$1.25 to \$3.00 a pound. The dividends thus obtained from the rubber estates—200 and 300 per cent—excited the British capitalists, then in a less degree the Dutch and the Belgians, and the 'Rubber Fever' began.' Our estimable confrère rather mixes up dates. In our pamphlet, '*Les intérêts Belges dans les Sociétés de Caoutchouc en Malaisie et au Congo*,' published at the end of 1919, we told that the Belgians had become interested in rubber plantations as early as 1887 by creating the syndicate of Malaysia. All this before the 'Rubber Craze' of which Mr. Pearson speaks."

We hasten to acknowledge that our friendly critic is right regarding the early appreciation on the part of the Belgians of the value of *Hevea* planting in the Far East. It was not the intention to seem to contradict this. The point was that the majority of the plantations installed during the rubber craze were financed by the British. To this we believe our amiable confrère will agree. (THE EDITOR.)

DETERMINATION OF THE SOFTENING OF PLASTIC MATERIALS.

IT HAS long been customary to compare plastic materials by such tests as melting point, twisting point, penetration, etc. These tests are valuable, but are not easily reproducible and do not give any indication of the various changes taking place under heat. It is for this reason that the following method has been adopted.

The instrument used for carrying out this test was the Widney Resiliometer, illustrated in Fig. 1, which was adapted so that with a presser foot, C, of $\frac{1}{8}$ -inch diameter, the weight, I, gave a pressure of 200 pounds per square inch. The metal base, D, was replaced by ebonite, in order that loss of heat through conduction should be as little as possible. The large dial, A, is graduated in 100 divisions, each $\frac{1}{1000}$ -inch, so that one revolution of the larger pointer or hand is equivalent to an elevation of $\frac{1}{10}$ -inch travel by the presser foot. When the material is more than $\frac{1}{10}$ -inch thick the hand will revolve more than once around the dial, the number of revolutions being indicated on the small dial B.

The operations are as follows: the thickness is first determined by placing the sample between C and D, the normal thickness being read off on the dial. The spring-catch, E, is now released, holding the weight, I, and the quadrant, F, allowed to swing until the pressure is put on the upper end of presser foot, G, at the top of dial. This forces the foot into the material until it reaches the limits of compression as the result of the weight applied. The reading on the dial at that time is taken and compared with the normal or original thickness. For example, a sample having a normal thickness of 100 mils. (one mil. = $\frac{1}{1000}$ -inch) gave a

reading at 200 pounds per square inch of 25, namely at this pressure the material would show a compression of 25 per cent.

A sample of convenient size for testing is 2.5-inches by 0.5-inch by 0.100-inch thick and is easily obtainable by aid of a small mold, the shape of the sample permitting several tests to be determined throughout its length.

"SOFTENING" THE TEST PIECE.

The test piece, which should be molded about twelve hours before testing, is placed in water at 60 degrees F. or lower, depending on the sample, and maintained at the required temperature for a few minutes to ensure that the sample is uniformly heated throughout. It is then quickly taken out, its compression taken and replaced in the bath, the temperature of which is then raised at the rate of about 4 degrees F. a minute to the next reading, the sample being tested at every 10 degrees F.

FIG. 1.

A, DIAL. B, REVOLUTION COUNTING DIAL. C, PRESSER FOOT. D, BASE. E, SPRING CATCH. F, QUADRANT. G, UPPER END OF PRESSER FOOT. H, TRANSMISSION PLUNGER. I, WEIGHT. K, TOOTHED PIVOT.

FIG. 2.

GRAPH SHOWING INFLUENCE OF TEMPERATURE ON COMPRESSION IN VARIOUS PITCHES.

When dealing with complex substances which have no definite constant, the value of these curves will be at once apparent. The author has found the curves most instructive and of great assistance in controlling running batches of material.

THE MERCHANTS' ASSOCIATION ELECTS NEW MEMBERS.

The Merchants' Association, New York City, on June 21, 1920, elected to membership the following individuals of interest to the rubber and allied trades: Edward C. Beard, 106 Diane street, New York City, assistant treasurer of The Beacon Falls Rubber Shoe Co., Inc., Beacon Falls, Connecticut; Frank Waldo, E. M. and F. Waldo, 11 Broadway, New York City, manufacturers and importers of dry colors for the rubber and allied trades; B. L. Atwater, 1889 Metropolitan avenue, Brooklyn, New York, vice-president of William Wrigley, Jr., Co., Brooklyn, chewing gum manufacturer.

STORAGE BATTERY DEVELOPMENT ON THE PACIFIC SLOPE.

Special Correspondence

JUST as the rapid and extensive distribution of automobiles on the Pacific Coast has within a few years resulted in the establishment in this section of branch factories to supply the urgent demand for cars, and has latterly stimulated the interest of enterprising tire makers in the trade possibilities of the Coast, with the resultant creation of an industry here that has already assumed huge proportions, so the widespread and ever-increasing use of motor cars in the territory between the Rockies and the western boundary of the United States has proved a powerful spur to the sale and production in this section of that automobile essential—the hard, rubber-celled storage battery.

Up to within a comparatively recent date, all the batteries used on cars west of the Rockies came from the East and Midwest; but now, while the older companies, through about 250 well-equipped service and replacement stations on the Coast, are holding their own very well, considerable inroads are being made into the field by some ten aggressive concerns that started here but a short time ago to manufacture electrical accumulators, many of the latter comparing well in efficiency with the products of the bigger and older factories nearer the Atlantic seaboard. Not only do these "youngsters" expect to get a considerable share of the Coast business, but they are also contending for a fair portion of the \$120,000,000 worth of battery replacements which, it is estimated, will be the nation's need in 1920.

Some idea of the opportunities for battery men on the Coast may be gleaned from the fact that on December 31, 1919, there were registered in California 493,463 automobiles (including trucks), in Oregon 83,332, and in Washington 164,080; or a total of 740,875 for the states bordering the Pacific. But as the Pacific coast territory is ordinarily held to include all the states quite west of the Rockies, Idaho should be added with 42,271, Nevada with 9,305, Arizona with 28,979, and Utah with 34,749; or a total for those four states of 115,304, which, added to the 740,875 in the first three states named, would make a grand total of 856,179 automobiles registered at the beginning of this year in the Pacific slope states. Experts in the trade figure that there has been an increase of at least 10 per cent since the date given, which would bring the total number of motor cars now in use in the territory named up to 941,747, as compared with an estimated present total in the entire United States of fully 8,000,000, the actual registration on March 1, 1920, having been computed by the Automobile Club of Southern California as being 7,718,020.

It might be added that no small impetus has been given to the storage battery business on the Pacific slope, as well as throughout the entire country, by the decision of the makers of the most popular low-priced cars in the United States to add to their 1920 models a complete electric lighting and starting equipment, and that new laws in many of the states now insist on motorists having lights that can be given efficiently only by means of storage batteries.

But storage batteries are used not only for lighting, starting, and ignition on gasoline automobiles. They are needed in ever-increasing quantities for propelling and lighting electric motor cars, for lighting and starting airplanes, launches, and fishing boats, for isolated house-lighting stations, for steam railroad switchwork and signaling (two being used on every block tower), for lighting steam railroad trains, for lighting street railway cars and for propulsion on many lines, for lighting ocean-going ships, for operating railroad and other draw-bridges, for numerous submarine boat needs, for starting and igniting stationary gas engines, for fire alarm service, for mine locomotives, for mine-workers' headlights, for blasting, and in radio and telephone work. So, too, are "stand-by" and "booster" storage batteries largely used in electric power and lighting stations for regulating the load, absorbing the surplus production of current when the

demand is light and releasing it when the demand is extra heavy, for equalizing momentary fluctuations due to irregular running of generators, for regulating voltage in certain classes of service, for controlling current supply on long feeders of street railway lines, and for emergency service, providing, as it were, a reservoir of energy to avert a complete shut-down of a station in the event of accident. One of the many recent minor applications of a storage battery is in connection with the propulsion of row-boats; the small gasoline engines much used for that purpose being supplanted by electric batteries.

Not content with merely merchandising and supplying service, the leading manufacturers of storage batteries on the Coast are carrying on considerable research work which they believe will result in increased efficiency and greater usefulness of an electrical device that is second in importance only to the dynamo itself, and that has even a much larger range of utility than the electrical generator to which it is invariably linked. Having made the hard rubber cells quite as light as the inclosing wooden case, they are now trying to reduce the weight of the lead plates and to reduce the bulk of the acid fluid or electrolyte without lessening the amperage or current quantity to make the perforated hard rubber separators used between the plates in certain types of batteries even more "porous" without loss in rigidity, to automatically check overcharge and overheating; and particularly are the experimenters endeavoring to overcome one of the greatest drawbacks of the storage battery—the long period of charging cells at stations, usually averaging from twelve to sixteen hours, and which period is always in direct ratio to the swiftness with which the battery has been discharged.

LIGHT AND CALCINED MAGNESIA.

Magnesia is an ingredient very commonly used in vulcanization, where it acts as the best mineral accelerator. It comes in two forms, light and calcined. These varieties in the dry state have very different volumes, but their specific gravities determined in paraffine oil are practically the same. The greater relative volume of light magnesia is not due to a finer state of pulverization than that of heavy magnesia. Its greater volume and apparent lighter gravity is due to its special structure which is little known to rubber workers and upon which too much emphasis cannot be placed, as all the qualities of the light form of magnesia are dependent on this particular feature of its structure.

To give a simple idea of the difference existing between two materials of different volumes, conceive one as a sphere and the other as a cylinder. A thousand spheres will occupy in any receptacle less space than a thousand cylinders of identically the same volume. One may thus liken a molecule of heavy magnesia to a sphere and a molecule of light magnesia to a cylinder. If these spheres and cylinders are placed in paraffine oil they will displace equal volumes. Thus, 100 grams of light magnesia occupies 763 cc. in a graduated flask while 100 grams of heavy magnesia occupies only 141 cc. If of two graduated flasks, each containing 100 cc. of paraffine oil, one adds equal weights of light magnesia to one and heavy magnesia to the other, then heats the flasks till all the air adhering to the particles of the magnesia has been expelled, it will be found on cooling that in the flask containing the heavy magnesia the volume occupied by the oxide is 129 cc. and in that containing the light magnesia the volume occupied by the oxide is 131 cc. Both volumes are practically the same and the marked difference of apparent volumes which exists between the two magnesias is due entirely to the occluded air which is different for each one.

THE AUTOMOBILE BUSINESS IN BRITISH MALAYA IS LARGELY IN American hands. Large stocks of parts and tires are kept and one firm maintains repair shops and sales rooms in Singapore, Kuala Lumpur, Ipoh and Penang.

News of the American Rubber Industry.

DIVIDENDS.

THE American Chicle Co., New York City, has declared its regular quarterly dividend of one and one-half per cent, payable July 1, on preferred stock of record June 19, 1920.

The Apsley Rubber Co., Lead & Smelting Co., New York City and St. Louis, Missouri, has declared a dividend of \$1.50 per share, payable August 2 on preferred stock of record July 15, 1920.

The Apsley Rubber Co., Hudson, Massachusetts, has declared its semi-annual dividend of three and one-half per cent, payable July 1 on preferred stock of record June 26, 1920.

The Brunswick-Balke-Collender Co., Chicago, Illinois, has declared its quarterly dividend of one and three-quarters per cent, payable July 1 on preferred stock of record June 20, 1920.

E. I. du Pont de Nemours & Co. (incorporated), Wilmington, Delaware, has declared a dividend of one and one-half per cent on its debenture stock, payable July 20 on stock of record July 10; also a quarterly dividend of four and one-half per cent and a stock dividend of \$2.50 a share, both payable June 15 on stock of record May 28, 1920.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has declared a quarterly dividend of 75 cents per share on its stock which has a par value of \$25, payable July 1 on stock of record June 15. This is the second dividend, the first having been paid three months ago. The company has also declared a quarterly dividend of \$1.75 a share, payable July 1 on first preferred stock of record June 15, 1920.

The Globe Rubber Tire Manufacturing Co., New York City, has declared a stock dividend of 10 per cent, payable July 1 on stock of record June 30, 1920, being the second 10 per cent stock dividend declared this year.

The Goodyear Tire & Rubber Co., Akron, Ohio, has declared a stock dividend of 150 per cent, to be paid from an accumulated surplus of \$43,000,000.

The Habirshaw Electric Cable Co., Inc., Yonkers, New York, has declared a quarterly dividend of 37½ cents on outstanding stock of no par value, payable July 1 on stock of record June 20, 1920.

The Kelly-Springfield Tire Co., New York City, has declared a quarterly dividend of \$1.50 per share, payable July 1 on its six per cent preferred stock of record June 15, 1920.

The Keystone Tire & Rubber Co., Inc., New York City, has declared its quarterly dividend of three per cent, payable July 1 on stock of record June 15, 1920.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has declared a quarterly dividend of one and three-quarters per cent, payable July 1 on preferred stock of record June 20, 1920.

The Madison Tire & Rubber Co., Inc., New York City and Buffalo, New York, has declared dividend No. 3, of 2 per cent, payable July 1 on preferred stock of record June 25, 1920.

The Martin Tire Corporation, 903 Sixth avenue, New York City, formerly The Triplex Tire Corporation, on March 10, 1920, declared a four per cent semi-annual dividend, payable March 20.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has declared dividends of one and three-quarters and one and one-half per cent, respectively, on preferred and common stock of record June 15, payable June 30, 1920.

The Salmon Falls Manufacturing Co., Boston, Massachusetts, declared a quarterly dividend of two and one-half per cent, payable June 1 on stock of record May 17, 1920.

The United Shoe Machinery Corporation, Boston, Massachusetts, has declared the following dividends: one and one-half per cent on preferred capital stock; \$1.50 per share on common 1920.

FINANCIAL NOTES.

The following financial statement of The Mason Tire & Rubber Co., Kent, Ohio, reflects the absorption of The Mason Cotton Fabrics Co., and the profit and loss statement shows net profits for the six months, amounting to \$689,000, that are three times as great as for the entire preceding twelve months.

Earnings of the newly-acquired textile division do not show as heavily as they will later in the year as that division has been in operation only a short time.

Balance Sheet, April 30, 1920.

Tire division, net profit	\$461,548.38
Textile division, profit, material sales	237,930.64
	\$699,479.02
Total net profits for six months	\$689,479.02

Port Washington, Wisconsin. To rubberize fabrics and to manufacture rubber cement.

Vacuum Rubber Heel Corp., May 24 (New York), \$50,000. M. Dusel, 45 Geil street; F. X. Muller, 26 Lyth street; E. J. Whissel, 685 Utica street—all of Buffalo, New York. Principal office, Buffalo, N. Y.

Vulcanoid Tire & Rubber Co., April 19 (Pennsylvania), \$100,000. W. C. Walsh, president and purchasing agent; E. W. Potteiger, vice-president; J. A. Maney, secretary; E. Smith, treasurer. Principal office, Pottstown, Pennsylvania. To rebuild tires.

Wadsworth Sales Co., Inc., May 28 (New York), \$20,000. E. J. Wadsworth, president; W. T. Leonard, vice-president; W. J. McDonald, treasurer; F. F. Acer, secretary. Principal office, 16 Court street, Brooklyn, New York. To distribute automobile tires, tubes and accessories.

Warner-Johnson Tire Co., The, April 15 (Ohio), \$15,000. S. B. Warner, president; W. T. Richards, vice-president; C. E. Lytle, secretary; S. E. Johnson, treasurer; W. H. Johnson, general manager. Principal office, Canton, Ohio. To distribute Pennsylvania Vacuum cup tires.

Weartex Rubber Co., March 31 (Pennsylvania), \$25,000. E. J. Hugo; G. R. Saleman, both of Philadelphia; L. Schulhof, Uniontown—both in Pennsylvania.

Youngstown Rubber Products Co., The, April 3 (Ohio), \$10,000. J. T. Harrington, U. C. Deird, J. P. Hoxley, N. A. Emery; D. J. Lynn, Principal office, 617 Market street, Youngstown, Ohio. To distribute tires, etc.

Ziegler Tire & Rubber Co., Inc., January 16 (Illinois), \$500,000. J. P. Driah, acting president and vice-president; F. J. Koldzinski, secretary and treasurer. Principal office, 706 Oxford Building, 118 North La Salle street, Chicago, Illinois. To manufacture tires.

A SUCCESSFUL ORGANIZER OF RUBBER COMPANIES.

WILLIAM WALLACE WILDMAN, the well-known organizer and manager of successful rubber companies, was born in Zanesville, Ohio, February 11, 1872. During his youth in Zanesville he attended the common and high schools, and after leaving school he worked in his father's furniture store. Later he became a member of the firm of J. B. Wildman & Sons. In 1891 he moved to Chicago, and was for six months in the wholesale house of Marshall Field & Co. His next connection was with the National Tube Works in Chicago until that company was consolidated with the Crane Company. He then went with James B. Clow & Sons in the same line of business, and remained with that firm for five years.

In 1897 Mr. Wildman entered the rubber field, joining the firm of Morgan & Wright as assistant superintendent of the mechanical rubber goods department in the Chicago factory. Three and a half years later he took charge of the sales of mechanical rubber goods, the compilation of catalogs, and the training of traveling salesmen in those lines. He was employed in that capacity for about four and a half years. When Morgan & Wright were then taken over by the Rubber Goods Manufacturing Company, Mr. Wildman resigned and went with the Milwaukee Rubber Works Co. When that company became involved in financial difficulties he conducted the business under the receivership for two years. After the first three months he made money for the company, and later organized the Federal Rubber Co., which purchased the assets of the old concern. Mr. Wildman was made general manager of the Federal company. After the plant had been in operation about a year he resigned and went to Akron.

Having developed and perfected a patented process for devulcanizing rubber scrap, he organized at Akron, in 1908, the United Rubber Co., which bought the plant of the old Aladdin Rubber Co., located in West Barberton, for the purpose of manufacturing reclaimed rubber.

When Mr. Wildman engaged in rubber reclaiming it was with the idea that as soon as the business was firmly established a larger and separate company should be formed for the manufacture of rubber goods. Thus he brought about the incorpora-

tion of The Portage Rubber Co. in 1910. Mr. Wildman was general manager from the start and subsequently was chosen president. He remained with the company until the fall of 1919, when he resigned and formed the Wildman Rubber Co. of Detroit, of which he is president. It is capitalized at \$10,000,000, and is building a big plant at Bay City, Michigan, preparing to turn out 2,500 tires and 5,000 tubes a day.

Mr. Wildman is a 32nd-degree Mason, resides in Detroit and is a member of the Akron and Barberton Chambers of Commerce and the Detroit Board of Commerce, the Akron City Club, and the Fairtown Heights Golf Club. In Detroit he is a member of the Fellowcraft Club and the Birch Hill Country Club. Three of his brothers, Banks J. Wildman, Theodore D. Wildman and Joseph W. Wildman, are, respectively, secretary, assistant sales manager and Chicago district manager of the Portage Rubber Co.

PERSONAL MENTION.

Howard H. McGee was born in Hartford, Connecticut, and in the early eighties his father, the late C. Thornton McGee, purchased the druggists' sundry business of the John W. Gray Co., whose factory subsequently became the Hartford Rubber Works Co. In 1900 Mr. McGee entered the employ of the Seamless Rubber Co., New Haven, Connecticut, starting in the factory and after two years' inside experience he represented the firm in the New England territory. In 1905, he was made manager of the Chicago office. Two years later, the Seamless Rubber Co. sent him to Europe to investigate trade conditions. After representing Davol Rubber Co. for several years in the south, Mr. McGee accepted the management of the druggists' sundries department of Ajax-Grieb Rubber Co., and for the last five years he has been connected with the United States Rubber Co.

HOWARD H. MCGEE.

Dr. Frederic Dannerth, the well-known rubber chemist, who last winter gave a series of lectures in Newark on corporation chemistry, has again established his office as consulting chemist in Newark, New Jersey.

S. V. Norton, for fifteen years with The B. F. Goodrich Co., Akron, Ohio, has resigned to accept the position of service manager of the General Motors Truck Co., Pontiac, Michigan, effective July 1, succeeding H. L. Beckwith, resigned.

R. L. Armstrong has been appointed manager of the Omaha branch of the Pennsylvania Rubber Co., Jeannette, Pennsylvania. He succeeds Dan McAvoy, resigned.

E. H. Watson, 98 Park Place, New York City, American representative of Alfred Smith, Limited, Manchester, England, manufacturer of chemicals for the rubber trade, is at present in England but expects to return to New York about the middle of July.

John H. Mills has been elected vice-president of the Hilo Varnish Corporation, Brooklyn, New York, which manufactures a flexible varnish for rubberized fabrics. Mr. Mills has been with the Hilo company for thirty-five years and for some time has been a member of the board of directors.

C. H. Connelly has been appointed southwestern manager of The Rubber Products Co., Barberton, Ohio, with headquarters at Kansas City, Missouri. He will control the territory from Nebraska to the Gulf and from St. Louis to Denver.

George B. Kretsinger has been appointed office manager of the Kansas City branch of The Rubber Products Co., Barberton, Ohio, effective July 1.

Colonel Samuel Pomeroy Colt and party of guests left Providence June 4 for Camp Colt in the Maine woods to enjoy a three weeks' fishing trip. The camp is located on Kidney Point

WILLIAM W. WILDMAN.

at the base of Mount Katahdin, amid beautiful scenery, some thirty-five miles up the Penobscot river from Norcross. Trout and bass fishing is unexcelled.

John W. O'Bannon, head of the International Rubber Co., carriage cloth manufacturers, and of the O'Bannon Corporation, manufacturers of a leather substitute, who has been committed to a sanitarium since the middle of April, has been declared by a sheriff's jury to be incompetent to manage his own affairs and a committee is to be appointed. Mr. O'Bannon's career has been a remarkable one. Starting on a shoestring, he built up his business to corporations in which he has a \$15,000,000 interest. Although declared mentally incurable by several alienists, he retains a wonderful mind and memory. He is still a young man of fifty and his friends in the rubber trade believe he will come back.

SALES MANAGER, SYRACUSE RUBBER CO.

FRANK G. MAUTHE, general sales manager of The Syracuse Rubber Co., Inc., Syracuse, New York, brings to that position an extensive and varied sales experience obtained with several prominent firms.

Born in North Clarendon, Pennsylvania, in 1883, he attended the grammar schools and from his boyhood until 1904 was engaged with his father in the mercantile business. Thereafter, for three years, he was store manager for the Vulcan Trading Co., then for two years department manager for the M. O'Neil Co., when, in 1910, he became an adjuster, office manager, and salesman for the Diamond Rubber Co. In 1912 he became identified with The Goodyear Tire & Rubber Co. as branch manager, which position he occupied until 1916, when he was appointed special factory representative of the Marathon Tire & Rubber Co., holding this office for three years. When the Syracuse Rubber Co. was organized in 1919 he accepted his present position as general sales manager.

Mr. Mauthe is a member of the Kiwanis Club, St. Albans No. 68 F. & A. M. and Branch Brook Chapter No. 47 Royal Arch Masons, both of Newark, New Jersey.

FRANK G. MAUTHE.

THE RUBBER TRADE IN THE EAST AND SOUTH.

By Our Regular Correspondent.

NEW YORK NOTES.

THE HUDSON Tire & Rubber Corporation has been incorporated under the laws of New York with a capital of \$1,000,000. The offices are at Yonkers, New York, where a twenty-acre tract of land has been acquired and a modern factory will be erected for producing cord and fabric tires, tubes, solid truck tires, and other rubber goods. The officers of the company are: W. M. Doucette, president and general manager, and H. B. Seymour, vice-president and treasurer. Mr. Doucette has been in the tire business for a quarter of a century representing manufacturers

in this country and abroad, and he was lately eastern district manager of The Mason Tire & Rubber Co. of Kent, Ohio. Mr. Seymour, who has been editor and business manager of "The Rubber Age and Tire News" and "Tire Trade Journal," entered the rubber business seventeen years ago with the Boston Woven Hose & Rubber Co. of Cambridge, Massachusetts, and later was with the Davidson Rubber Co. of Charlestown and the Plymouth Rubber Co. of Canton, Massachusetts.

Leslie & Knoke is the firm name of a new copartnership of crude rubber brokers, at 60 Stone street, New York. One of the partners is Charles S. Leslie, who started as an office boy 23 years ago with Reimers & Meyer and stayed through the successive changes in that house until it became Poel & Kelly. About a year ago he began business by himself. The other partner is Edward J. Knoke, who began twenty years since with Eggers & Heinlein, then went to Robinson & Co. and later to Constantino P. Dos Santos. When that firm was reorganized he went with Albert V. Tallman and three years ago became an independent broker.

The National Association of Corporation Schools, which includes some of the largest employers of labor in the United States, held a five-day convention at the Waldorf-Astoria, New York, the first week in June. The committee making a report on unskilled labor and Americanization included C. S. Coler, Westinghouse Electric & Manufacturing Co.; S. H. Renton, American Hard Rubber Co.; and B. N. Rohrer, The B. F. Goodrich Co.

The Rubber Corporation of America, recently organized, has its general offices at 240 West 55th street, New York City. The officers are: F. I. Reynolds, president, also vice-president and director of sales of the Empire Tire & Rubber Corporation, Trenton, New Jersey; Charles Austin Bates, vice-president, in charge of advertising, also vice-president of the Sterling Tire Corporation, Rutherford, New Jersey; W. A. Reynolds, J. Baker Taylor, Ralph V. Dickinson, and William D. Harris, vice-presidents in charge of sales; W. M. Pepper, chairman of the board, a member of the New York banking firm of Campbell, Heath & Co.; A. W. Fargo, secretary; directors—F. I. Reynolds, C. E. Murray, Sr. and Jr., C. A. Bates, J. A. Miller, W. T. Baird, W. M. Pepper, and Charles Austin Bates.

The company will maintain warehousing facilities in eight or ten of the principal cities in the United States where the goods of manufacturing companies will be warehoused and thence distributed. The selling organization will be much under the same direction and will perform for the manufacturing companies an economical selling and distribution service.

The Watson-Stillman Co., New York City, manufacturer of rubber machinery, packing, etc., has elected the following officers: E. A. Stillman, president, supervising sales; Carl Wigtel, vice-president and chief engineer; J. D. Brooks, treasurer; and A. Parker Nevin, secretary. LeRoy T. Brown has been appointed works manager, J. W. Delano, assistant works manager, and W. H. Martin, purchasing agent. The board of directors includes E. A. and A. F. Stillman, Carl Wigtel, A. Parker Nevin, W. L. Wright, George T. Ordway, and F. A. Hutson. G. D. Kershaw and J. F. Lary are no longer with the company and the positions of general manager and superintendent have been discontinued.

The Majestic Sales Corporation, 1834 Broadway, New York City, will distribute in the eastern and northeastern states the products of the Majestic Tire & Rubber Co., Indianapolis, Indiana, maker of Majestic cord tires and tubes. G. W. Chapman, formerly with The Fisk Rubber Co., is New York district manager, and S. J. Anderson, formerly with the Brunswick-Balke-Collender Co., is in charge of sales in the New York territory.

The Advance Rubber Co., Brooklyn, New York, is completing its new plant, 200 by 130 feet, and expects to occupy it about

July 1. Cord tires and tubes will be added to the present line of fabric tires and by-product horse-shoe pads. L. M. Kaplan is secretary of the company.

Thos. E. Wilson & Co., Chicago, manufacturer of sporting goods, has purchased the factory of the National Base Ball Manufacturing Co., Schenectady, New York, and will continue in charge John H. Grady as director of the baseball manufacturing division of the Wilson company.

At its annual meeting held recently, the General Electric Co., Schenectady, New York, reelected the former directors and officers.

Among the exhibitors in the permanent International Exposition of Industries, which the Merchants' and Manufacturers' Exchange of New York is operating at the Grand Central Palace, there are many whose exhibits will interest the rubber trade. We note: New York Rubber Co., Schaeffer & Budenburg Manufacturing Co., McNutt Can Sales Co., Portable Machinery Co., Spadone Machine Co., Brunswick-Balke-Collider Co., Converse Rubber Shoe Co., The Raybestos Co., Revere Rubber Co., Tagliabue Manufacturing Co., Westinghouse Electric & Manufacturing Co.

Mitsui & Co., Limited, Japanese importer, has appointed M. Kobayashi its New York representative, with headquarters at 65 Broadway, the New York City office.

CONNECTICUT NOTES.

The Seamless Rubber Co., New Haven, has entered into a sales arrangement with Adolph Perlroth, a real estate dealer, whereby the latter will take its old plant and cut it up into smaller divisions for selling purposes. The Seamless company expects to move into its new plant at an early date.

The Carlisle Tire Corporation, 250 West 54th street, New York City, and Andover, Massachusetts, has purchased all the assets of the Carlisle Cord Tire Co., Inc., and early in June had completed approximately 85 per cent of the new factory now building at Stamford, Connecticut. It expects to have the new plant in operation about the middle of July. Cord tires and truck tires will be manufactured exclusively. The concern is incorporated for \$3,000,000 preferred stock and 300,000 shares of common without par value, under the laws of Delaware. J. S. McClurg is production manager.

PENNSYLVANIA NOTES.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has elected the following directors for the ensuing three years: Guy E. Tripp, chairman of board; Joseph Marsh, H. H. Westinghouse, and Albert H. Wiggins. George W. Davison, president of the Central Union Trust Co., New York City, was selected by the board of directors to succeed James N. Wallace, deceased, and was elected by the stockholders for the term expiring June, 1921.

The Westinghouse Air Brake Co., Wilmerding, Pennsylvania, and not, as reported, the Westinghouse Electric & Manufacturing Co., has acquired ownership and control of the Westinghouse Union Battery Co., Swissvale, Pennsylvania.

The Vulcan Rubber Co., Erie, Pennsylvania, has just completed a two-story building, 76 by 123 feet, in which it is installing machinery for the manufacture of cord tires. It also plans to increase its production of fabric tires, for which it has purchased additional equipment.

The Allen Tire & Rubber Co., 510 Hamilton street, Allentown, Pennsylvania, has completed the organization of its \$2,500,000 company and expects to start production of tires and tubes in September in the factory which is now under construction. The officers of the company are: Wilmer Dunbar, president; H. F. Clemmer, vice-president; T. S. Johnson, secretary; J. T. Leathers, treasurer. A. C. Leathers and Fred Leathers are sales agent and fiscal agent, respectively.

"The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has leased for the summer season a commodious cottage at Put-In-Bay, Ohio, for the purpose of providing vacation quarters for the young women in its offices. Twelve can be accommodated at once, and each girl will have a two weeks' vacation. A competent chaperone will be in charge.

Blakey & Hall, Pittsburgh, Pennsylvania, have been appointed distributors for the product of The India Tire & Rubber Co., Akron, Ohio.

The U. S. Compression Inner Tube Co., Inc., Tulsa, Oklahoma, has bought the property of the Kattanning Plate Glass Co., Kattanning, Pennsylvania, and will remodel the buildings at once for an eastern factory. A new structure will also be built in the spring. This factory will take care of the company's business east of the Mississippi river.

The Black & Decker Manufacturing Co., Towson Heights, Baltimore, Maryland, has moved its Philadelphia office, of which W. C. Allen is branch manager, to more spacious quarters at 318 North Broad street.

At the organization meeting of the Industrial Cost Accountants' Association at Chicago, on June 18, M. F. Simmons of the General Electric Co., Schenectady, New York, was elected president; C. H. Smith of the Westinghouse Air Brake Co., Wilmerding, Pennsylvania, was elected first vice-president and A. A. Alles, Jr., of the Fawcett Machine Co., and the Schaeffer Engineering and Equipment Co., Pittsburgh, Pennsylvania, was chosen secretary-treasurer. Headquarters of the Association will be in Pittsburgh, at the office of the secretary-treasurer, 1501 Peoples' Bank Building.

SOUTHERN NOTES.

C. F. Batton, who has been with the Atlanta and Birmingham branches of The Fisk Rubber Co. for the last four years, has been made manager of the new branch office recently opened at Jackson, Mississippi. Mr. Batton served nine months in the army during the war and was a second lieutenant in the Sixth Pioneer Infantry at Camp Sherman, Ohio, when discharged. The Jackson branch is the 128th to be established by the Fisk company in this country.

C. F. BATTON.

The McClaren Rubber Co., Charlotte, North Carolina, has appointed Charles G. Miller chief chemist. He was formerly assistant chemist of the Racine Rubber Co., Racine, Wisconsin.

The India Tire & Rubber Co., Akron, Ohio, has given the distribution rights for its products in Baltimore, Maryland, and the surrounding territory to Frank G. Schenut.

The Kentucky Tire & Rubber Association, 502-503 Realty Building, Louisville, Kentucky, will begin excavation and construction on its new factory as soon as its railroad switch, now being laid, is completed. It expects to have the factory completed, also, in about four months.

R. H. Brown, formerly with the Kelly-Springfield Tire Co., in Akron and the Ideal Tire & Rubber Co., Cleveland, Ohio, has been engaged as superintendent of the new factory to be built by The Kentucky Tire & Rubber Association, Louisville, Kentucky.

The DuBois Rubber & Tube Co., 315-318 Volunteer State Life Building, Chattanooga, Tennessee, recently incorporated for the purpose of manufacturing a compression inner tube of the type that does not leak air when punctured, will also make the ordinary inner tubes and tire casings. It intends to increase its capital to \$2,000,000 in the near future. The officers are: J. D. DuBois, president; L. H. Lightfoot, vice-president; P. B. Whit-

aker, secretary and treasurer; M. N. Whitaker and J. A. Stith, directors, in addition to the other officers.

The Hopewell Insulation & Manufacturing Co., Inc., Hopewell, Virginia, will begin about July 15 to manufacture hard rubber, condensation molded insulation parts, molded high tension insulators for all wireless and transmission purposes, etc. It uses the trade marks "Paramold," "Synthek," and "Himcomite" on its hard rubber, high heat, and composition products, respectively.

With headquarters and general offices in Atlanta, Georgia, Couch Cotton Mills, Inc., has been formed by the consolidation of Couch Mills Co., Atlanta, Georgia, Beaver Duck Mills, Greenville, South Carolina, and Beaver Cotton Mills, Thomson, Georgia, with a capital and surplus of approximately \$2,500,000. The officers are: Asa G. Candler, Sr., chairman board of directors; W. D. Couch, president; L. J. Powers, vice-president and secretary; and Walter T. Candler, treasurer. In addition to these, the board of directors includes A. P. Coles, Atlanta, Georgia, A. W. Townsend, New York City, and S. M. Graves, Charlotte, North Carolina. No change is contemplated in the management of the separate mills, which are in full operation day and night and manufacture a wide range of fabrics, including light-weight drills, beach cloths, filter twills, wide, sail, army and heavy belting ducks, etc., for both domestic and foreign use. Sales offices are maintained at 320 Broadway, New York City, in charge of A. H. Penfield.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

MISCELLANEOUS NEW JERSEY NOTES.

A DECREE signed by Chancellor Walker dismissing the bill of Clement Eckrode, of Highland Park, against the Endurance Tire & Rubber Co., of New Brunswick, on the ground that the Court of Chancery has no jurisdiction to interfere with the internal affairs of a New York corporation, has been filed with the county clerk of Middlesex county. Mr. Eckrode sought to set aside a conveyance by the company.

The Rubber Goods Manufacturing Co., New Brunswick, has filed a certificate of dissolution in the office of the Secretary of State. The company was incorporated in 1884 by Samuel Moore, Walter S. Bolton, Charles Clair, Lester Leland, Thomas E. Sawyer and James Deshler.

The Rubber Tire Co., of 32 Branford place, Newark, of which Russell T. Binder is president, will erect a three-story addition, 26 by 30 feet, to the present structure. The building will be of brick and will cost \$16,000.

The Driver-Harris Company, Harrison, New Jersey, manufacturer of electrical wire, etc., has just completed a three-story building, 50 by 100 feet, which will later be increased to 50 by 200 feet. The contracts for the addition have already been let. The top floor will be used as a general office and the second for manufacture.

The Red Raven Rubber Co., 152-158 Sussex avenue, Newark, New Jersey, has bought the Ideal Wheel Tire Co. of the same city.

The Smith Rubber & Tire Co., Inc., 625 Main avenue, Passaic, New Jersey, expects to begin production about the middle of August. Machinery, molds and tire-building stands have been ordered, and the new factory is rapidly being completed. The officers of the company are: Winfield Clearwater, president; Fred W. Smith, vice-president; Dudley Gordon, secretary; and Thomas A. Hopkins, treasurer.

The Stanwood Rubber Co., Elizabeth, New Jersey, that absorbed the Hardman Rubber Corporation, of New Brunswick, New Jersey, has New York offices at 6 East 30th street. It supplies unvulcanized gums—tread, camel back tread, cushion, tube repair and cured-back tube gums; fabrics—building, bead, breaker

and cord fabrics; and cements—vulcanizing, patching and quick-curing vulcanizing cements and acid-curing solution.

K. H. Dresser was promoted early in 1920 to the position of branch manager of The Goodyear Tire & Rubber Co. at Newark, New Jersey. Mr. Dresser's first connection with The Goodyear Tire & Rubber Co. was in 1912, as assistant manager of the mechanical goods department at Akron, Ohio. A year later he was sent to Portland, Maine, as branch manager, remaining until April 1, 1915, when he was transferred to a similar position at Springfield, Massachusetts. In the summer of 1917 he was recalled to Akron to act as staff man on motorcycle tires, and was soon placed in charge of the cycle tire department. On January 1, 1918, he was sent to the New York and New England districts in connection with the company's second sale of preferred stock, in which he was exceptionally successful. He was then attached to the manufacturers' sales department, with headquarters in New York City, and continued this work until transferred to his present position.

TRENTON NOTES.

The Bergougnan Rubber Co., Trenton, has begun the erection of three additions to its plant, and will eventually double the size of the works. One of the buildings is two stories high and measures 60 by 120 feet. Another is a machine shop, two stories, 40 by 170 feet. A good-sized storage building is about to be completed. The company will expend between \$50,000 and \$60,000 for new machinery. The buildings will be of brick and steel with concrete floors. The new operations will cost \$100,000. The largest addition will be used for the manufacture of tires.

The Thermoid Rubber Co., Trenton, will purchase about \$100,000 worth of machinery to be used in the new addition now being erected. The company will not yet disclose the nature of the machinery, which is being purchased through the builders, Karno-Smith Co., of Trenton.

The Empire Tire & Rubber Corporation has made complaint to the City of Trenton in an effort to have portions of the Assanpink Creek filled in. The company has suffered considerably through water backing up in the creek and flooding the lower floors of the plant.

The Essex Rubber Co. Mutual Benefit Association, Trenton, has elected the following officers: James Kelly, president; C. L. Stokes, vice-president; Walter Gratton, secretary, and E. R. Rogers, treasurer; Miss Catherine Franks, J. V. Hall and J. Oscar Reynolds, members of the executive committee.

The employees of the Essex Rubber Co. recently held an entertainment and dance at the Crescent Temple, Trenton. W. G. Sanders, J. C. Cartledge and L. M. Oakley comprised the committee in charge.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

EXPANSIONS AND IMPROVEMENTS at the plant of the Revere Rubber Co., on Eagle and Valley streets, Providence, continue, several projects being under way at the present time. Among these is the erection of a garage building with all modern appointments and equipment with a capacity to start for 25 cars. The building is so planned that additions can be made as necessity demands.

Work has been started on two large additions to the plant of the Jenckes Spinning Co., Pawtucket, that have been made necessary by the increasing demands upon the company for textiles used in tire production. One of the new structures is to be a four-story manufacturing building of brick, mill construction, 128 feet long and 100 feet in width, to cost about \$100,000. The other is a two and one-half story addition on top of the present storehouse, which is about 100 feet long and 70 feet wide, of brick fireproof construction.

The corporation return of the Jenckes Spinning Co. has been filed at the office of the city clerk of Pawtucket. It sets forth

that April 26, 1920, an addition of common stock of \$1,800,000 was issued, making 10,000 shares of preferred stock, par value \$100 each share, total \$1,000,000, now outstanding; and 36,000 shares of common stock of par value of \$100 each, total par value \$3,600,000 now outstanding, and that of said stock had been paid in. The certificate is signed by LeRoy Fales, president; F. L. Jenckes, treasurer; J. W. Baker, secretary; also by LeRoy Fales, Albert A. Jenckes and F. L. Jenckes, a majority of the board of directors.

The Elastic Webbing Co., Pawtucket, Rhode Island, has completed plans for the erection of its proposed new plant at Dixfield, Maine, to consist of a four-story mill, 100 by 150 feet, to cost about \$100,000. The structure will be located on a site near the Webb river.

The American Wringer Co. is to erect a three-story brick manufacturing building near its plant on Clinton street, Woonsocket, Rhode Island, the plans for which are all ready. It is to be 90 by 42 feet, of the slow-burning type of construction, and is to cost about \$20,000.

Philias J. Savoie and Frank R. Larson are the proprietors of the Savoie Rubber Manufacturing Co., 17 Blackstone street, Woonsocket, Rhode Island, according to their statement filed at the city clerk's office in that city.

The National India Rubber Co., Bristol, has decided to operate a branch factory of the shoe division in Newport, Rhode Island, where a site has been selected and a building is to be erected at once. The branch factory will include the stitching department and about 200 young women will be employed at the start, and this number will be increased as the work progresses. It is planned to have the new branch ready for operation by September.

Leon F. Ballou has resigned his position with the shipping department of the Alice Mill, Woonsocket Rubber Co., having been appointed traffic manager for the Alice and Millville plants of the Woonsocket company. On the day that he left his old position, on behalf of his former associates John Riley, who succeeded him as foreman of the shipping department, presented him \$25 in gold.

A factory paper is to be organized at the plant of the National India Rubber Co., Bristol, in the near future, all plans and arrangements having already been made. An editor has been appointed and an office is being fitted up for his use. A contest for the name by which the paper shall be known is under way, and a prize will be given for the winner, a ballot to be taken on the best eight names proposed.

The additions and improvements that are being made at the plant of the Mount Hope Spinning Company, at Warren, Rhode Island, are being pushed toward completion as rapidly as possible. The new addition to the main section, 100 by 200 feet, is practically finished; the sprinkler system is already installed throughout and the electric power is ready for use; the piping has been completed and the plumbing is nearly done. The 40 by 70 addition to the old plant is also nearly completed.

George W. Romprey, a repairman of Woonsocket, Rhode Island, has been adjudged a bankrupt upon an involuntary petition filed by three creditors who were: The Goodby-Rankin Co. of Rhode Island, with a claim for \$2,576.35; The Fisk Rubber Co. of New York, \$2,096.31 and The B. E. Goodrich Rubber Co., of Ohio, for \$2,352.42. Elisha C. Mowry has been appointed receiver.

A new 100,000-gallon steel water tank is being erected by the O'Bannon Corporation at its rubber plant at Bay Spring in West Barrington, Rhode Island, for protection against fire.

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS" AND "RUBBER MACHINERY," by Henry C. Pearson, should be in the library of every progressive rubber man.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

BOSTON NOTES.

ONE of the latest problems added to the already long list of rising costs is that of motoring in general and of tires in particular. If the life of a set of automobile tires can be prolonged 25 per cent, the saving is four times the increased cost of gasoline for a season. With this in mind, and to help combat the high cost of motoring, The B. F. Goodrich Co. recently inaugurated a "Save-Your-Tires" week in Boston, as it has done in other cities. As an important part of the program many local motion picture houses exhibited during that week the Goodrich film entitled "Striking Tires." It is of the humorous cartoon type and drives home in an entertaining manner the most serious features of tire neglect and points out the things a motorist should avoid in order to extend the life of his tire equipment.

The Pennsylvania Rubber Co. has appointed L. J. Waldron as its New England manager. Mr. Waldron has been selling Pennsylvania tires for five years, previous to which he was connected with The B. F. Goodrich Co. for a like period.

The Gillette Rubber Co. agency, the Gillette Tire Co., at 587 Boylston street, Boston, has been taken over as a factory branch with Frank C. Stetson as district manager. Mr. Stetson was formerly with the Lee Tire & Rubber Corporation. He has been selling tires in New England for eighteen years, and is one of the oldest tire salesmen in the country in point of service.

The Lambert Tire & Rubber Co., Akron, Ohio, has opened a store for the New England distribution of the Lambert "Trublrpruf" cord tire at 823 Boylston street, Boston. The officers of the Boston concern are A. J. Millward, James J. O'Brien and L. H. Plummer. The Lambert tire is built with stretchless cord belts placed between layers of rubber with air holes placed around the tire in such a way as to give it the resilience of a pneumatic. It contains no inner tube and requires no inflation.

The old Park Riding School, in the center of the tire district at Ipswich and Lansdown streets, where the élite of Boston learned to ride horseback, has been remodeled and equipped as a storage warehouse for tires by The B. F. Goodrich Rubber Co. The premises consist of three buildings, affording a total of 73,000 square feet. Here the company will garage its cars and maintain a large distributing center. F. D. Keen, formerly assistant operating manager, has been placed in charge.

The India Tire & Rubber Co., Akron, Ohio, has appointed W. W. Alexander as its factory representative in New England, with headquarters in Boston. Mr. Alexander is well acquainted with the New England trade through long association with the Diamond Rubber Co. in the early days of the industry. He comes to the India Tire & Rubber Co. from the Dayton Tire Co.

The Converse Rubber Shoe Co., Malden, has opened a Boston salesroom at 801 Boylston street for the sale of Converse cord tires. F. R. Goodell, formerly in charge of New York footwear sales for the company, is manager.

The Joseph E. Greene Co., 113 Federal street, Boston, has been appointed New England distributor for Empire tires and tubes.

R. R. Cowen, of the sales force of the E. H. Clapp Rubber Co., Boston, was married on June 19 to Miss Mabel S. Thompson, an alumna of Smith College, class of '18. Mr. Cowen is a graduate of Harvard College, class of '16. He enlisted in the Army during the late war and was assigned to Camp Zachary Taylor, where he earned a commission as a lieutenant of artillery.

Boston's Ancient and Honorable Artillery Company observed its 282nd anniversary on June 7, 1920, and at the annual drum-head election chose Captain Francis H. Appleton, Jr., adjutant. He is following close in the steps of his father, who, as Commander of the organization, led the peaceful "invasion" of England. In the war the son was Captain of the 67th Company of the State Guard.

MISCELLANEOUS MASSACHUSETTS NOTES.

The tire division of the Converse Rubber Shoe Co., Malden, Mass., is now in charge of Dr. Ernest A. Wullenweber, an expert of twenty-two years' experience in the chemical laboratories of leading rubber companies. For ten years he was in the Morgan & Wright factory of the United States Rubber Co. at Detroit, Michigan, and he came to the Converse forces from the Mid-Continent Tire Manufacturing Co., of Wichita, Kansas. Under his direction the Dainty Maid shoe factory is being converted into an enlarged tire plant, and henceforth Converse tires will take a more prominent place in the trade.

All factory operatives of the Converse Rubber Shoe Co., Malden, are now protected by three forms of insurance. Life and accident insurance have been in effect for some time, but effective June 1 a disability insurance was added. Under this policy every employee will receive 60 per cent of the regular weekly earnings whenever more than seven days are lost through sickness of any kind, or accident or injury sustained outside of the factory.

The George Grow Tire Co. has found day and night production necessary to meet the demand for Grow tires, and the factory at Canton Junction, Massachusetts, is soon to be enlarged.

The Monatiquot Rubber Works Co., of South Braintree, Massachusetts, has let a contract for the construction of a second siding on the Plymouth Division of the New York, New Haven & Hartford Railroad. This will open up for manufacturing purposes a very desirable allotment of land on which it is probable that an independent reclaiming unit will be built and the company's plans for housing employees, which were held up by the war, may be carried through to completion. It will also enable the company to store coal for a year's consumption.

Dining with music is an excellent feature of the big new employees' restaurant on the roof of the Hood Rubber Co. office building at Watertown, Massachusetts. The force boasts a wealth of musical talent and volunteers are providing daily instrumental and vocal concerts during the noon hour that send the Hood operatives back to their work singing. This attractive cafeteria is serving seven hundred luncheons daily and small branch lunch counters have been established in different parts of the factory to take care of those who do not go to the main restaurant.

The New England Tire & Rubber Co., 285 High street, Holyoke, Massachusetts, is to build a factory on a site recently acquired from the Holyoke Water Power Co., for the manufacture of the "Holyoke" cord tire and the "Connecticut Valley" inner tube. Plans for its construction are now being completed and it is expected that building operations will begin at an early date. The factory will be planned to produce 1,000 tires daily, and the latest machinery will be installed. The officers of the company are: George K. Culp, president, sales manager and director, formerly with the United States Rubber Co., the G. & J. Tire Co., and The Mid-Continent Tire Manufacturing Co.; E. J. Kearns, vice-president and production manager, formerly with The Fisk Rubber Co. and the Lee Rubber Co., also associated with the Dunlop Pneumatic Tyre Co. of Australasia, Limited; C. S. Huntley, treasurer, general manager, and director, formerly with the Delton Tire & Rubber Co. and the Midco Tire Co., Inc.; and S. R. Huntley, secretary and director. The other directors include: George P. O'Connell, T. E. Morris, W. C. Van Brunt, F. W. Callahan, John Kearns, J. Sidney Bernstein, and Joseph F. Ranger. The company is incorporated under the laws of Delaware with a capitalization of \$1,500,000 of eight per cent preferred stock and \$1,500,000 of common stock with par value of \$10. Executive offices are maintained at 43 East 47th street, New York City.

The Crompton & Knowles Loom Works, Worcester, Massachusetts, has increased its capital stock from \$6,000,000 to \$8,000,000. John F. Tinsley, vice-president and general manager

of the company, has been appointed a representative of employers on the committee named by the Massachusetts Department of Labor and Industries to frame a safety code in the wood-working machinery industry.

The new Industrial Banking System introduced by the Boston Woven Hose & Rubber Co., Cambridge, has had a wonderful success. The plan was instituted in cooperation with the Manufacturers' National Bank of Cambridge to enable the employees to have all the conveniences of a savings bank without having to take the time to go to the bank to open an account or make a deposit. All banking except the withdrawal of money is handled in the plant. One dollar opens an account and encourages the small earner to start saving. When the money is collected a sum corresponding to the amount of money deposited is placed in the employees' bank book, and a duplicate stamp of the same number goes with the money to the bank. Stamps have no negotiable value, serving simply as a memorandum of deposit. Although only in operation a short period, nearly 300 accounts have been opened and the average amount deposited weekly at the present time is in the vicinity of \$500. It is safe to assume that a large percentage of this amount would not otherwise have been laid aside.

A WELL-KNOWN TIRE MACHINERY INVENTOR.

THOMAS MIDGLEY, consulting engineer and inventor, now in charge of the development work of The Fisk Rubber Co., Chicopee Falls, Massachusetts, has for many years been well known for his activities in devising new and better machines for the manufacture of tires.

Born in London, England, in 1860, Mr. Midgley soon came to America, and was educated in the public and evening schools of Worcester, Massachusetts. In 1874 he secured employment in a shoe factory, and four years later became a time-keeper and foreman in a wire mill in Worcester. This experience led in 1884 to his appointment as superintendent of the Hartman Steel Co., Beaver Falls, Pennsylvania. Four years later he started in business on his own account manufacturing wire goods and torpedo nets.

In 1896 he accepted the position of superintendent of the Columbus Bicycle Co., Columbus, Ohio, and four years later again went into business for himself manufacturing steel wheels and automobile tire rims.

His first direct connection with the rubber industry was in 1905, when he became consulting engineer for the Hartford Rubber Works, Hartford, Connecticut, and allied companies, notably Morgan & Wright. In 1914 he was manager and one of the incorporators of the Midgley Tire & Rubber Co., a West Virginia corporation, and the following year of the Midgley Tires Co., an Ohio corporation. After developing a tire-building core for the Interlock Core Co., Columbus, Ohio, in 1917, he went to his present work at the Fisk plant.

Mr. Midgley is perhaps best known as the inventor of the Midgley collapsible core, though he has taken out numerous patents for miscellaneous tire machinery, some of the later ones being devices for wrapping bead wire and for trimming beads and tire flaps.

He is a member of the Society of Automotive Engineers and the Benevolent Protective Order of Elks.

THOMAS MIDGLEY.

FIRESTONE'S WESTERN SALES MANAGER.

FRANK K. STARBIRD, western sales manager of the Firestone Tire & Rubber Co., Akron, Ohio, is one of Ohio's enterprising native sons. Born in New London, Ohio, in 1885, he

FRANK K. STARBIRD.
to western sales manager, with headquarters in Akron.

was educated in the local grade and high schools and later in Ohio State University, at Columbus. He entered the employ of the Firestone company in April, 1916, beginning in the advertising department where he was soon made manager of the dealers' advertising department. Later, his activities being transferred to sales, he became manager of the pneumatic sales department, then manager of the Northwestern district, embracing the Minneapolis, Great Falls, Minot, Fargo and Des Moines branches, with headquarters in Minneapolis. At the beginning of the present year he was promoted

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

AKRON NOTES.

WORKING against transportation difficulties and the beginning of refinancing following the war period, were the dominant features of the rubber industry in Akron during the past month. The production of tires and rubber goods has been greatly retarded by the railroad situation and possibly by the credits extended by bankers to the industries. Although no definite announcements have been made, it is understood by bankers in the city that a large number of men have been laid off indefinitely and plans are under consideration for further curtailment unless the situation clears up in the very near future.

For some time after the railroad situation became serious the rubber factories employed truck trains to bring in fabric, which was scarce in the city, and in several instances armed trains were employed to bring fabric from the East. But after raw materials were supplied it became impossible to ship out manufactured goods. As a result it is generally understood, although no official statement has been forthcoming, that large amounts of manufactured goods are stored in warehouses and old buildings awaiting an opportunity to ship.

However, the effect of the temporary depression upon the city is not regarded as serious by the manufacturers or Akron bankers. In an interview given by D. R. Held, cashier of one of the largest banks and dean of Akron bankers, he expressed the opinion that this situation is exactly the thing needed to bring business back to its normal basis. "All our industries had gone mad about business and they were attempting to do more than they were able to handle, and if the switchmen's strike had not occurred it is not unlikely that business would have received a severe blow by the continued inflation. As it is, the business men were warned in time to curtail and the depression will come and go without leaving any failures in its wake," he said to the correspondent of **THE INDIA RUBBER WORLD**.

The freight situation in Akron proper has been entirely cleared up and the resumption of normal shipping of goods depends entirely upon the increase in efficiency of the transportation system outside of the city itself.

The following promotions in the executive force of The B. F. Goodrich Rubber Co., Akron, were recently announced: V. I. Montenyohl and L. L. Smith, credit managers, have been made

assistant treasurers, and W. C. Arthur, assistant secretary and counsel.

V. I. Montenyohl has been connected with the Goodrich company for thirteen years, having started in 1907 as a stenographer in the treasurer's department. He began his credit work in 1910 and after several years handled the more important duties of the credit department. He was appointed credit manager in the spring of 1917.

L. L. Smith, who has completed twelve years of service, became connected with the Goodrich company in 1908 as receiving clerk in the tire adjusting department, and later was advanced to tire adjuster and then to assistant manager of the Kansas City branch. In 1914 he was made special salesman in the Kansas City territory. He was transferred to the Akron credit de-

L. L. SMITH. V. I. MONTENYOHL. W. C. ARTHUR.

partment in 1915 and after two years in that department was made credit manager.

W. C. Arthur became associated with the Goodrich company in 1917 when the legal department was organized. He is a graduate of the University of Pittsburgh, class of 1907 and took his law degree in 1913.

The B. F. Goodrich Co., Akron, announces the following changes in personnel: F. W. Jones, formerly in charge of footwear sales, has been assigned to special sales work; W. E. Hawkins will succeed Mr. Jones as manager of footwear sales, and F. C. Garrett will succeed Mr. Hawkins as operating manager, assisted by A. W. Thompson, formerly chief clerk at the Akron branch. H. A. Staley will combine the duties of chief clerk and adjuster at the Akron branch.

Athletes of The B. F. Goodrich Co., for the fourth time in succession, won the Akron Industrial League track meet championship Memorial Day, the results being: Goodrich, 59 points; Goodyear, 58; Firestone, 56, and Miller, 16.

Rex Lake, one of the largest industrial playgrounds in the world, which is operated for the employees of The B. F. Goodrich Co., has been opened for the season. The sports at the grounds include baseball, tennis, cricket and soccer, as well as boating and canoeing. Boats and fishing tackle are provided for those who wish to fish. Special playgrounds for children have been provided and a large roomy cottage equipped with kitchens, dining and rest rooms has been remodeled for the season.

Honoring Mr. and Mrs. John R. Gammeter, who left June 23 for a tour of Europe, employees in Mr. Gammeter's department at The B. F. Goodrich Co. gave a banquet at Young's Hotel, June 3, presenting Mr. and Mrs. Gammeter with a leather-bound book containing the autographs of those present. About 156 paricipants in the event.

The Firestone Tire & Rubber Co. plant was recently closed down for thirty minutes to enable the men to hear in three mass meetings the story of the "Inter-Church World Movement," staged by Protestant churches to obtain more than

\$350,000,000 for improvement of church work. H. S. Firestone, president, was one of the speakers at the meetings.

A branch of the Akron public library will be opened at the Firestone Club House at an early date. Carpenters have been at work preparing a special room to accommodate it.

The controlling interest in the Biltwell Tire & Rubber Co., Akron, has been purchased by The Wildman Rubber Co., 816 Book Building, Detroit, Michigan. The following officers have been elected, the former ones having resigned: W. W. Wildman, president and general manager; M. Braley, vice-president, and C. R. Twynham, secretary-treasurer. In addition to the above, the directors include L. C. MacGregor, Detroit, Michigan; George W. Sieber, J. C. Clinefelter and E. H. Trump, Akron, and B. O. Erling and A. F. Stuehlrehr, Barberton, Ohio. The Biltwell factory has a daily capacity of 500 pneumatic tires and 1,000 inner tubes, which will presently be doubled by an addition to the plant. The Biltwell will henceforth be financed by The Wildman Rubber Co.

The Akron Rubber Mold & Machine Co., Akron, has broken ground for an extensive addition to its plant which will more than double its present capacity for the manufacture of tire building and tire repair equipment. The present plant covers more than 75,000 square feet of floor space. Particular demand is being made for equipment for producing cord and giant pneumatic truck tires, and the company's foreign trade is now greater than ever before in its history. New machinery ordered for the extension is being temporarily installed in the present quarters in order to increase production without waiting for the completion of the addition.

C. W. McLaughlin, vice-president and treasurer of the Mohawk Rubber Co., was one of the principal speakers at the annual convention of Federal Reserve bankers at Cleveland the latter part of May.

John R. Gammeter, of The B. F. Goodrich Co.; W. E. Wright, donor of a flying field; B. A. Polsky, president of the Akron Chamber of Commerce; Mayor Carl F. Beck, C. W. Schierling, R. K. Crawford, I. S. Myers, George Kile, Ralph H. Upson and S. W. Worley were named an honorary board of governors of the Akron Flying Club at a meeting held recently. The meeting followed a field day in which a large number of planes were demonstrated and passengers carried. Approximately 8,000 persons witnessed the flights.

The Goodyear Tire & Rubber Co., Akron, announces the following promotions in its sales organization. L. C. Gates has been made manager and H. E. Waldsmith has been selected as branch manager at Akron.

L. C. GATES.

L. C. Gates entered the employ of the company in a clerical capacity in the assistant division of the automobile tire department in 1915, and was soon transferred to city sales work in the Philadelphia, Pennsylvania, branch. His next step forward was as assistant manager at Philadelphia, followed in 1919 by assignment as manager of the Dayton, Ohio, branch. Owing to his organization ability his promotion to the management of the motorcycle tire sales division of the automobile tire department at Akron followed early in 1920.

H. E. Waldsmith's first connection with the Goodyear company began in 1915 as a special traveling representative in the bicycle and motorcycle tire department. After a year he was assigned to sell Goodyear motorcycle tires. In 1918, he was transferred to the automobile tire department, and in about a year was promoted to special representative, calling on dealers and motorcycle manufacturers. On July 1, 1919, he was appointed branch manager

at Youngstown, Ohio, where his splendid record brought further recognition early in 1920 by his appointment as branch manager at Akron.

The Goodyear Tire & Rubber Co. has announced that the Wingfoot aviation station recently purchased from the Government, will be thrown open to the general public in the very near future and the dirigible purchased from France will be on the ground for exhibition and test purposes. A large number of improvements are being made in the field.

The Goodyear engineering department will soon move into a new five-story building which is now being completed.

P. W. Litchfield, factory manager of the Goodyear Tire & Rubber Co., was the principal speaker at the simple unveiling of a tablet dedicated June 2 to the one hundred and five Goodyear men who gave their lives in the world war.

The stores established by the various rubber companies in order to reduce the cost of living to their employees have proved a success. The Goodyear Tire & Rubber Co. store, opened recently, did \$4,000 of business the first day and thereafter the average sales a day have been \$8,000.

Thirty motorcycle riders formed the initial membership of a motorcycle club organized in Akron. Their first meeting was held at the Firestone clubhouse. A gypsy tour for the latter part of June was the first event arranged by the new club. William W. Twite is president of the new organization.

CLEVELAND NOTES.

The Erie Tire & Rubber Co., Cleveland, Ohio, at meetings of stockholders held May 11 and May 26 voted to increase the capitalization of the company from \$4,000,000 to \$10,000,000, due to the remarkable growth of the company during its first year. The following directors were elected, two new ones being added: P. F. Wills, H. H. Forrest, M. C. Phillips, F. W. Hildebrand, A. M. Mander, C. V. Goepper and E. L. Braeunig.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has appointed G. E. Bovis manager of the Cleveland branch, succeeding E. F. Thompson, who recently went to the Pacific Coast. Mr. Bovis was formerly manager of the McGraw branch in Des Moines, Iowa, previous to which connection he was with The Fisk Rubber Co. at Sioux Falls, South Dakota.

The General Rubber Goods Co., Cleveland, Ohio, has increased its capital from \$50,000 to \$100,000. Griswold Wilson is president and Lindsay H. Wallace secretary and treasurer.

The Thor Tire and Rubber Co., 802 Society for Savings Building, Cleveland, with factory at Willoughby, Ohio, was incorporated under the laws of Ohio on December 1, 1919, with a capitalization of \$1,000,000 consisting of \$500,000 each of preferred and common stock. The first unit of the factory, which is 200 by 40 feet, has been practically completed, and mechanical rubber goods will be manufactured there at an early date. The main building will be 400 by 90 feet, with a capacity of 3,000 tires and 500 tubes. The property covers 44 acres, adjoining the New York Central railroad. M. W. Gary is secretary.

The partnership of Fanner & Brown, engineers, has been reorganized under the name of The Associated Engineers' Company, with offices at 130 Engineers' Building, Cleveland, Ohio.

The 1920 Credit Convention of the Motor and Accessory Manufacturers' Association, has been tentatively scheduled for Thursday and Friday, September 16-17, at Cleveland, Ohio. In view of the vital problems affecting the automobile industry, in relation to the general financial and credit conditions, it is believed that this year's credit convention will be one of the most interesting and important in the history of the association. Further details concerning the meeting will be announced later.

The National Sales & Trading Co. has removed from the Swetland Building to the entire sixth floor of the Racine Build-

ing, 11th and Chestnut streets, Cleveland, Ohio, in order to take care of increasing business in chemicals for the rubber trade.

JOHN MORGAN, PRESIDENT OF THE MCGRAW TIRE & RUBBER CO.

At a special meeting of the board of directors of the McGraw Tire & Rubber Co., East Palestine, Ohio, on June 5, John Morgan, formerly vice-president and treasurer, was unanimously elected to the presidency, succeeding the late Edwin C. McGraw, founder of the company, who died at his southern home, Miami, Florida, on May 24, 1920.

Mr. Morgan will also continue to serve as treasurer. He has been associated with the company almost since its inception ten years ago and has taken an active part in shaping its policies.

Mr. Morgan was born in London, England, in 1880, and in 1905 came to America to introduce the Kempshall tire into the United States. He is a director of the Rubber Association of America.

JOHN MORGAN.

MISCELLANEOUS OHIO NOTES.

C. D. Rockwood, purchasing agent of The Mason Tire & Rubber Co., Kent, Ohio, has returned from the Far East. In connection with J. P. Mathews, the resident manager of the Mason Rubber Plantations Co. at Singapore, he has been undertaking negotiations for acquiring additional rubber plantations for the company.

Four men were killed and approximately fifty injured when a benzol tank exploded June 7 as the result of a fire in the spreader room of The Mason Tire & Rubber Co. plant at Kent, Ohio.

The Turner, Vaughn & Taylor Co., Cuyahoga Falls, Ohio, has changed its corporate name to "The Vaughn Machinery Co." C. W. Vaughn is still president and L. A. Vaughn secretary and general manager, and there will be no change in management, while the complete line of Vaughn machinery will be manufactured as heretofore.

The Giant Tire & Rubber Co., Findlay, Ohio; The I. J. Cooper Rubber Co., Indianapolis, Indiana, and Cincinnati, Ohio; and The Cooper Storage Battery Mfg. Co., have consolidated under the name, "The Cooper Corporation," with headquarters at Eighth and Main streets, Cincinnati, Ohio.

The Republic Rubber Corporation, Youngstown, Ohio, has elected the following officers and directors: William Wilms, chairman of the board; E. F. Jones, president; C. H. Booth, L. T. Petersen, H. J. Woodard and C. F. Garrison, vice-presidents; H. J. Stambaugh, treasurer; Arthur L. Irish, secretary. Directors—C. H. Booth, H. M. and Richard Garlick, Robert Bentley, R. E. Cornelius, John T. Harrington, E. F. Jones, R. C. Steese, John Tod, T. E. Borton and William Wilms.

The Rubber Products Co., Barberton, Ohio, has elected the following officers: W. A. Johnston, president; C. C. Schutz, vice-president and general manager; J. W. Blaser, treasurer; E. J. Schutz, assistant treasurer; J. M. Wylie, secretary; J. B. Chisnell, assistant secretary.

The Marion Tire & Rubber Co., Marion, Ohio, has elected the following officers: L. B. Walters, president; W. E. Cameron, vice-president; Sam F. Zilliox, treasurer; C. W. McLaughlin, secretary; W. P. Haynes, assistant secretary and assistant treasurer. Directors—Allan F. Ayers, R. C. Ellsworth, S. F. Zilliox, C. W. McLaughlin, L. B. Walters, R. D. Belden, W. E. Cameron, W. H. Holverstott, J. W. Jacoby and W. A. Patterson.

The Rotary Tire and Rubber Co., Zanesville, Ohio, has appointed as its sales manager, with headquarters at Zanesville, R. B. Ford, formerly special representative and branch manager of The B. F. Goodrich Co. at Utica and Syracuse, New York, and at Columbus, Ohio.

The Knox Tire & Rubber Co., Mt. Vernon, Ohio, is building a new factory for the manufacture of cord and fabric tires and red and gray tubes. The latest machinery, including equipment for making goods in millimeter sizes to take care of foreign business, will be installed. The building will be three stories high, 100 by 225 feet, of concrete, brick, and steel construction. F. D. Spencer is secretary-treasurer.

The McWade Tire & Rubber Co., Garrettsville, Ohio, has purchased a factory site on which it will build a plant to manufacture a full line of cord and fabric tires and mechanical goods, including a pneumatic inner tube that will not become deflated when punctured. The officers are: J. H. McWade, president; C. C. Cox, vice-president and general manager; H. G. Vincent, secretary and treasurer.

**THE RUBBER TRADE IN THE MID-WEST.
MID-WEST RUBBER MANUFACTURERS' ASSOCIATION.**

THE RECENT BULLETINS of the Mid-West Rubber Manufacturers' Association have contained much material of interest to members; the weekly review of the crude rubber market and the special topics have been of timely interest. Some of these are: a report on employment in the automobile industry, in April, 1920; a plea for reduction of prices leading to an increase of business; a quotation from the bulletin of the First National Bank of Philadelphia, in which William A. Law, president of that institution, points out the difficulties of efficient banking to-day due to the shortcomings of the postal system; and the decision of the Council of National Defense not to urge early buying and storing of coal, because of the existent difficulties of transportation.

The next meeting of the Association will be held on July 13 in the Chicago Athletic Association Building, 12 South Michigan avenue, Chicago, Illinois.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, and New York City, has removed its Chicago office from the People's Gas Building to its own building at 323 North Michigan avenue. H. L. Dawson is manager of the Chicago office, which handles the business of nineteen states with sub-offices in Cincinnati and Detroit.

The Empire Zinc Co.'s new plant at Cañon City, Colorado, work on which was begun only four months ago, is already roasting ore. The concern is a subsidiary of the New Jersey Zinc Co. The Cañon City plant is modeled on the zinc oxide plants of the company at Palmerton, Pennsylvania, and care will be taken to keep the quality of the products uniform. The other portions of the plant are nearly ready, the chief ground for uncertainty being the railroad situation. It is believed that zinc oxide will be produced at the plant much sooner than was expected.

The Latex Tire & Rubber Co., Fond du Lac, Wisconsin, has completed its new plant and office building, including the main factory building, 50 by 150 feet, two stories high, and the power

PLANT OF LATEX TIRE & RUBBER CO.

plant, 50 by 40 feet. The factory is located on East Scott street and is equipped with up-to-date machinery. It is planned on the unit system and other units will be added as the business develops. F. S. Danenberg is president of the company.

The Majestic Tire & Rubber Co., Indianapolis, Indiana, has elected the following officers: R. H. Syfers, president; E. B. Oscars, vice-president; and George O. Wildhack, secretary-treasurer.

The Miller Rubber Co., Akron, Ohio, has opened a branch at 3 East Water street, Milwaukee, Wisconsin, where 30,000 feet of floor space have been leased and a preliminary shipment of twelve carloads of tires made.

The Parker Tire & Rubber Co., Indianapolis, Indiana, has increased its capital from \$750,000 to \$3,000,000, and is drawing up plans for the erection of a new factory building 600 feet long, 100 feet wide, and two stories high. When completed and equipped, it is estimated that the company will have a capacity of 2,000 tires daily. The company emphasizes white in every possible way in connection with its business, its letterhead even having the name embossed with a die instead of the usual printing.

The Rubber Sales Co., 53 West Jackson Boulevard, Chicago, Illinois, has been recently organized for the purpose of marketing various rubber products pertaining to the automobile industry in Chicago and the Middle West. F. E. Kaepfel, formerly with the Federal Rubber Co. and the Mechanical Rubber Co., is president. The company acts as direct mill agents.

The Tong-em-on Vulcanizer Co., Minneapolis, Minnesota, has changed its name to Risk's Riskless Vulcanizer Co., as also the name of its product, which was described in THE INDIA RUBBER WORLD April 1, 1920, under the old name.

The Wildman Rubber Co., 816 Book Building, Detroit, Michigan, has purchased the controlling interest in the Biltwell Tire & Rubber Co., Akron, Ohio, as noted elsewhere in this issue. The Wildman company will operate the Biltwell plant in addition to the one it is to erect at Bay City, Michigan.

The Morgan & Wright plant, Detroit, Michigan, is being enlarged by the addition of a two-story building, 90 by 275 feet, and a power plant.

SALES MANAGER, SAVAGE TIRE SALES CO.

JOHN ELDEN SHAW, sales manager of the Savage Tire Sales Co., Des Moines, Iowa, was born in Saylesville, Rhode Island, September 21, 1886. After completing his education

in a business college he became a newspaper reporter, which is a valuable training preparatory to any sort of business career.

His first experience with the rubber industry commenced some ten years ago with the L. A. Vulcanizing Co., of Los Angeles, California. Early in 1914 he started with the Savage Tire Co., of San Diego, California, as credit man in the Los Angeles branch, later being transferred to the factory as credit manager, then promoted to traveling auditor and soon to special salesman. In February, 1918, he was ap-

pointed assistant sales manager, and eleven months later was advanced to sales manager. In this position he greatly

increased sales and changed the company's policy from a consignment to a straight sales basis, and on February 1, 1920, resigned to go into business for himself.

Mr. Shaw has a wide acquaintance in social and fraternal as well as business circles and is a member of the B. P. O. Elks No. 168 of San Diego.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent.

LOS ANGELES NOTES.

LOS ANGELES is the largest city west of St. Louis, according to the United States census return for 1920, which gives the population of Los Angeles as 575,480, in contrast with that of San Francisco, which has 508,410.

Another large rubber plant is coming to Los Angeles. It is the Fabri-Cord Tire Company of California, which has purchased thirty acres adjoining the Vista del Oro tract on Seventh street in the San Pedro harbor section of the city, and construction will begin August 1 on a plant that will ultimately cost \$2,000,000. The first unit will be a three-story building of reinforced concrete, 60 by 250 feet, costing when equipped, \$80,000 for the building and \$200,000 for the machinery. The initial output will be 500 cord tires and 1,500 tubes a day, and 400 men will be employed. Eventually the company plans to employ 1,700. Electricity will be used wholly for power.

The E. M. Smith Co., Los Angeles, manufacturer of Emsco products consisting of rubber belting, brake linings, clutch facings and other rubber-asbestos and textile products is a twelve-year-old concern of which E. M. Smith is president and general manager. The factory buildings now built and under way are of

CALENDER ROOM, E. M. SMITH CO.

reinforced concrete and include a rubber mill, a textile mill, a power plant, garage, machine shop, belting factory, warehouse and offices. The plant is the only one west of Chicago making clutch facings for automobiles. It uses more than 25,000 pounds of canvas monthly and it is all bought in California. Emsco products are being shipped to Arizona, Texas, New Mexico, Wyoming, Oklahoma, Kansas, and other states as far east as Philadelphia.

Goodyear tires are being made in California. The first "native son" tire to be made in the Golden State and bearing the "Wing-foot" brand was turned out at the Los Angeles factory on June 14, 1920. As the casing was removed from the molds and pronounced perfect, the whistles of five Goodyear factories, namely, in Los Angeles, Akron, Ohio, Toronto, Canada, the cotton mills at Goodyear, Connecticut, and the ginning mills on the Goodyear cotton plantation in Arizona, in unison greeted the birth of the tire. It is a model 30 by 3-inch, plain tread, single-cure fabric tire of the clincher type and will be placed in the Goodyear Products Museum in Akron.

JOHN E. SHAW.

The severest test of solid truck tires ever made in this section took place recently when a 73-ton, 40-inch naval gun was transported from the Southern Pacific railroad freight yards at San Pedro to Fort McArthur, adjoining Los Angeles harbor. The huge gun was so placed that 23 tons rested on dollies and the remaining 50 tons on a single trailer, which is believed to be the greatest weight ever imposed on solid tires. Two 40 by 12 solids were used on the front wheels and four 40 by 10 solids on the rear wheels of the trailer, all Goodrich tires.

Rubber-tired auto vans have replaced the horse-drawn mail carts in Los Angeles, the postoffice department having just installed thirty-seven of the motor vehicles. There are nineteen 1-ton, thirteen $\frac{3}{4}$ -ton, three 2-ton, and two $2\frac{1}{2}$ -ton vans now in use.

W. D. Newerf, W. S. Melcher, and Carl Newerf have formed the Tire Sales Company to market in Los Angeles the Western States tires made by the Washington Tire & Rubber Co., Spokane, Washington.

While no affirmation or denial has been made by the Miller Rubber Co., Akron, Ohio, of the rumor current here for several months that it intended to build a large plant in Los Angeles, the impression persists that the company is maturing plans to that end. F. C. Millhoff, general sales manager, and W. S. Campbell, advertising manager, of the Miller company, have been spending much time lately in this section.

The U. S. Compression Inner Tube Co., Inc., Tulsa, Oklahoma, in addition to its new plant acquired in Pennsylvania, will build another this winter on a site to be purchased immediately in Los Angeles. From this it will serve its customers in the territory west of the Rockies, and from Tulsa, those between the Rockies and the Mississippi.

It is estimated that the annual bill for tires for the 1,500 motor stages operated daily over the fine highways of California is not

Shoedeaders' Association which opened at San Diego on June 7.

Bert Mosser, who is the Pacific Coast representative of the India Tire & Rubber Co., Akron, Ohio, has gone East to hurry up tire shipments. Local distributors have been seriously hampered by depleted stocks.

J. Ralph Campbell, long with The Fisk Rubber Co., has been appointed manager of Guasti, House & Giulli, Inc., Los Angeles, southwestern distributor of Perfection tires. Mr. Campbell recently visited the Perfection plant at Fort Madison, Iowa.

J. A. Peterson has succeeded J. R. Campbell as manager of the Los Angeles branch of The Fisk Rubber Co., Chicopee Falls, Massachusetts. For a little more than three years he has been manager of the company's branch at Sacramento where J. A. Jack, a salesman for the last three years, has been appointed manager.

Tire users have been greatly interested in an animated cartoon recently shown here that depicted a supposed strike of abused tires against unreasonable use by their owners. The film was entitled, "The Striking Tire" and was supplied by The B. F. Goodrich Co., Akron, Ohio, as part of the nation-wide campaign against the neglect and misuse of tires.

J. B. Magee, general manager of the United States Rubber Company's southern California and Arizona branches, has been making a thorough study of trade conditions in the northern part of California, first with J. B. Brady, Pacific Coast manager, at San Francisco and afterward as far as Klamath Falls, Oregon, with T. H. Wilkinson, manager for that section, and L. M. Simpson, manager of the Sacramento branch.

The George W. Eno Rubber Co., Los Angeles, has purchased the mold for the Ehman half-sole tire from the Ehman Tire & Rubber Co., and is just concluding experiments looking toward applying this mold to a whole-sole tire which the Eno company will soon turn out in quantity under its own name.

Employees of the Los Angeles Goodyear tire plant have organized a 60-piece band under the leadership of Frank Marsales, who also heads the Elks' band in Los Angeles. The Goodyear employees have also organized a baseball team, and thus far they have won 10 of the 12 games played.

It has been claimed that half of the automobile tires made in the United States are sold west of the Mississippi river. Asked by THE INDIA RUBBER WORLD representative whether such a statement was true, an official of one of the largest tire-making concerns in the country stated that his company's sales in the fourteen states nearest the Pacific Coast and all the Pacific exports total but 10 per cent of the company's entire business.

A PIONEER TIRE CO.

A prosperous young company is the Samson Tire & Rubber Corporation, whose general offices are at 333 West Pico street, Los Angeles. Although launched during the war, it has flourished remarkably. It has a plant at Compton, a nearby city, and is running it up to capacity.

The first unit of the new plant now under way is a three-story brick building of mill construction 50 by 200 feet. Besides the batteries of machines, mixers and calenders, there will be big press-vulcanizers and the latest machines and devices for tire work. The plant will be on a main line of railroad and have its own siding. There is plenty of water, cheap electric power, and a fine class of help always available.

The officers are especially proud of the fact that the plant is free and clear, that the company has no bonds or preferred stock, and that it discounts all purchases.

NEW PLANT, SAMSON TIRE & RUBBER CORPORATION.

less than \$1,200,000. The average run for each is 150 miles a day, and a mileage of 12,000 is figured for each of the five tires carried.

Roy R. Meads, president and general manager of the Pacific Rubber Co., has returned to Los Angeles from a visit to the Horseshoe tire factory in Racine, Wisconsin, and a visit to the various distributing agencies of the company on the Pacific coast.

W. J. Coe, of the United States Rubber Company's Los Angeles branch, attended the annual convention of the California Retail

The Samson concern is said to be the pioneer on the Pacific Coast in the making of full-modeled, modern constructed, supersized cord tires, facilities having been provided for turning out all sizes up to 38 by 5; and all in addition to a wide variety of standard tires.

SAN FRANCISCO NOTES.

J. W. Thomas, vice-president of the Firestone Tire & Rubber Co., and three of the factory engineers, J. C. Tuttle, A. A. Warner and L. G. Greenwald, have just completed a prolonged survey of the automobile industry on the Pacific Coast, with especial reference to road and traffic conditions affecting tire products, solid and pneumatic. Incidentally Mr. Thomas has been giving inspiring talks to Firestone tire distributors at luncheon-conferences in several coast cities.

H. P. Lawson has been appointed assistant district manager for the San Francisco branch of the Willard Storage Battery Company. Mr. Lawson, who has been with the Willard concern four years, is well-known and popular among the trade.

L. E. Crittenden has bought a half interest in the Tire Sales Company formerly owned solely by Johanna Pulver and D. P. Miles.

NORTHWESTERN NOTES.

With the first cargo of rubber brought to the northwest port since the Pacific Steamship Company established its service between Seattle and Singapore a few months ago, the Admiral line freighter *West Hartland* arrived at Seattle June 10. Since 1918, the record year in Seattle's import and export trade, most of the rubber from Singapore has moved through Gulf and Atlantic ports.

W. D. Albright, of Seattle, northwestern distributor for The B. F. Goodrich Rubber Co., has broken all records in tire shipments to the Pacific Coast. He induced his company to send a trainload of tires on May 29 from the Akron factory to relieve a pronounced shortage in the Northwest, which is felt by all dealers.

The Michelin Tire Co. has leased a two-story building at 41 Front street, Portland, Oregon, from which C. L. Normyle, branch manager, will supervise Michelin sales all over the Northwest through sub-branches at Seattle, Spokane, Butte, Great Falls and Boise.

The Emery Retread Co. will erect a three-story modern tire service building at 1115 East Pike street, Seattle.

John A. Leatherman, J. M. Albert, and R. W. Huntoon, of Seattle, have incorporated the Leatherman Tire & Rubber Co. with \$2,000,000 as authorized capital.

The first unit of the new factory of the Occident Rubber Co., Kirkland, Washington, has been completed and \$20,000 worth of up-to-date machinery has been installed. Work has also been started on a second building, the two to cost \$150,000. While the company will for a while continue to make a general line of rubber goods, it is also planning to turn out automobile tires later in the year.

SOUTHWESTERN NOTES.

What is practically an addition to the cotton acreage of Arizona is the new plantation being developed just across the Mexican border, where Harry Mount, president of the El Tigre Oil Co., Tampico, Mexico, and Arturo de la Torre, Mexico City, have taken title to several thousand acres of land in Sonora on the eastern bank of the Colorado river and extending from Arizona to the Gulf of California. The sale was made by the heirs of the Andrade estate who live in Los Angeles. Long-staple cotton will be planted at once and experts say the section is ideally suited for such a crop.

Owing to scarcity of labor in Imperial Valley, some cotton growers are paying as much as \$1 an hour to Hindu cotton-choppers.

The Spreckels "Savage" Tire Co., San Diego, has for a second

year been granted the exclusive concession for the sale of tires and tubes in Yosemite National Park.

Through its purchase from Miller & Lux of the Boltonwillow 100,000-acre ranch thirty miles west of Bakersfield, the Goodyear Tire & Rubber Co. will become, it is said, the largest cotton-raising concern in the world. The big California tract, like the others owned by the Goodyear concern in Arizona, will be planted to Pima long-staple cotton needed for tire fabric.

According to F. W. Griffith, vice-president of the Garlock Packing Co., Palmyra, New York, his company is considering the building of a western factory in Los Angeles.

THE TOWN OF LITCHFIELD.

Military triumphs in the olden days resulted in naming cities after great leaders, as Rome after Romulus, Constantinople in honor of Constantine, and so on. To-day industrial leaders receive a like honor. Thus Paul W. Litchfield, one of the most

(Universal Film Manufacturing Co.)

THE TOWN OF LITCHFIELD, ARIZONA.

brilliant and successful of the latter-day rubber superintendents, has his name attached to a thriving town in Arizona where the Southwestern Cotton Co. has its headquarters. It is an honor well deserved and will bring good fortune to the community.

THE "TRUFLITE" TENNIS BALL.

One of the new tennis balls is made with a four-piece center with rubber plug, in such a way, it is claimed, that there is no opportunity for leakage or deflation. The special feature of this ball is the felt cover which is applied by a special process so as to be stitchless and seamless. The "Truflite" tennis ball was approved by the United States National Lawn Tennis Association in February of this year. (The Seamless Rubber Company, Inc., New Haven, Connecticut.)

(Patent applied for.)

"ESSEX" HEEL REST.

ACCELERATOR HEEL REST.

A heel rest for use by automobile drivers provides deep curved recesses of rubber for the heel to brace against, so that the pressure on the heel is not at the extreme end but is flung forward where it naturally would come when walking. The curve prevents the heel from slipping sideways and offers real support. The "Essex" heel rest comes packed ten in a carton. A patent on this device has been applied for. (Essex Rubber Company, Trenton, New Jersey.)

PROTECTIVE RUBBER BLANKET FOR ELECTRIC LINEMEN.

A blanket intended for use by electric linemen in repairing cross-country high-voltage lines is composed of special character duck coated on both sides with a rubber compound to resist high voltage. The edge is beaded on all four sides to strengthen it and prevent tearing, and the material is extremely pliable. The blanket measures 35½ inches square and weighs from 5½ to 6 pounds. (W. H. Salisbury & Co., Inc., 308-310 West Madison street, Chicago, Illinois.)

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

A POINT about the increasing prices of rubber goods, notably those in which cotton and other high-priced materials figure largely, has been brought forcibly to my attention. This is that large buyers such as the big manufacturing combines are not replacing their rubber goods so frequently as has been their wont. They have discovered that where more care is taken of them their life and utility can be made to last longer; in other words, they are getting more work out of them, and subordinates have been instructed to fall in line with the new policy. I met a rubber manufacturer recently who was taking quite a gloomy view of this new procedure which had led to certain customary orders being adjourned to some future date. This cannot, fortunately, have anything to do with the Greek Calends because with the most careful usage rubber manufactures have only a finite life.

The centenary of the foundation of Thomas Hancock's rubber works in Goswell road falls in the present year, and it is interesting to hear that the directors of the present company are recognizing the event by reprinting his "Personal Narrative" of the origin and progress of the "Caoutchouc or India-Rubber Manufacture in England." I do not know whether there has been a previous reprint, but the date of publication of the copy in my possession is 1887. No doubt there will be many among the younger rubber chemists, if not among those of mature years, who will be glad of the opportunity of possessing a copy of the book.

THE PROOFING TRADE.

The fall which has taken place in the price of seed oils is somewhat slow in its effect on the price of rubber substitutes, no change to the advantage of the buyer of the latter having occurred at the time of writing. Of course the increased cost of substitutes is not all attributable to oil values, as labor and chemicals are also up. With regard to vulcanizing, although sulphur may be expected to come down, there seems little likelihood of bisulphide of carbon and chloride of sulphur following in its wake. This bears upon the relative cost of the dry-heat and cold-cure processes. At one time the cold cure was decidedly the cheaper of the two, but now they are much the same and it has become customary to take the costs of the two processes as similar in works calculations.

Recrimination between the cloth supplier and the waterproofer, where there is any complaint by the purchaser of the finished article, is a well worn theme, each in perfect faith putting the blame upon the other. One or two cases which have given rise to the customary amenities have been associated with khaki-dyed cloth as a component part of rubber-proofed clothing, and altogether the defects seem trivial enough. Nothing is alleged against the waterproof properties of the garments, the complaint being limited to the fact that when tested with water by the special method adopted by the purchaser some alteration in the tint of the khaki color takes place. With regard to the various methods used by purchasers to test waterproofs, it certainly seems desirable that some standard test should be adopted and also that this test should be specified and particularized when the goods are being contracted for. As it is, the person is at a disadvantage in not knowing to what test if any the goods are to be subjected.

Reports from the works indicate that as regards new business, slackness is somewhat prevalent, and this may be taken as supporting the statements emanating from other trades to the effect that the populace is not spending money so freely as was the case a year ago. It must be remembered in this respect that the millions distributed among officers and men

have now been spent, except in those few cases where the gratuities were invested.

Another instance where the making-up side of the business is to be carried on by a separate company associated with the rubber works is that of the Premier Waterproof and Rubber Co., Limited, of Manchester. A new company called Premier Garments, Limited, has been registered with a capital of £90,000 in £1 shares, of which 80,000 are cumulative preference, to take over the making up and selling of the waterproof garments and piece goods of the above company. Until the new premises are ready for occupation the new company will conduct its business from the rubber works. W. Lilley is on the board of both companies.

The police in some of our smokiest towns are now being supplied with the well-known white, single-texture mackintoshes worn in the past almost exclusively by coachmen. They are certainly more conspicuous than the ordinary dark blue or black coats hitherto worn, but it is to be hoped that the makers will not be held responsible if the white color undergoes a change.

The report of J. Mandleberg & Co., Limited, the Manchester waterproofing house, for 1919 is of the usual satisfactory nature, the distribution on the ordinary shares including a bonus of 7½ per cent, being 22½ per cent. As in many other businesses the high cost of materials and the necessity for expansion to cope with new business have made it imperative to issue further capital and it is proposed to issue a further 150,000 ordinary £1 shares and also to create 150,000 eight per cent preferred ordinary shares. These shares are to be offered at par to directors and others engaged in the management of the company at the directors' discretion.

SOCIETY OF CHEMICAL INDUSTRY'S ANNUAL REPORTS.

The volume for 1919 is now at hand, and, as was the case in 1918, the chapter dealing with progress in the rubber industry is from the pen of Dr. Twiss, chief chemist of the Dunlop Rubber Co., Limited. He mentions that now the war is over, details referring to manufactured goods are more frequent, and gives footnote reference to various papers that have been published in THE INDIA RUBBER WORLD. To the busy man who, despite the best intentions, cannot always manage to keep up with the flow of technical literature, the summary given by Dr. Twiss of the scientific papers relating to the industry published during the year will be found very useful. Rubber patent literature as such is not specially dealt with, perhaps because of the dreary monotony of the rubber-like bodies made from fish, tar or what not, and which the inventor rarely lives to see in regular use. The tendency of fine powders, such as precipitated barium sulphate, to become coarser under the mixing process is specially referred to in connection with Harting's United States patent covering the use of minced powders in the form of a paste with water or other liquid. Dr. Twiss, however, thinks that the practical difficulties in the way of doing this appear to be serious, though he suggests that glue and other colloids might usefully be applied in the form of an aqueous jelly. Referring to the use of glue in rubber, Dr. Twiss quotes American practice without saying whether it is used in Europe.

FUSION OF TIRE MAKING AND COTTON SPINNING INTERESTS.

It is announced that Belgrave Standard Tyres, Limited, of Oldham, has acquired a controlling interest in the Beldam Tyres, Limited, of Brentford, near London. Other firms in this fusion are the Belgrave Mills Co., Oldham, the Standard Tyres Co., Oldham, the Standard Tyre and Rubber Manufacturers, Limited, of London; the spinning and manufacturing

concerns of Robert McLure and Sons, Limited, of Stockport and J. and W. Bourne, Limited, of Highton, near Preston. It would seem from this that the tire making part of the combine will have no need to go short of textile fabric.

GALOSHES.

The position as regards retailers' supplies is very different from what it was a year ago. The erstwhile scarcity has given place to plentiful stocks which at the end of the winter season are causing some little perturbation to the retail rubber stores. As the winter was very mild throughout and there was hardly anything in the way of a snowfall, sales have not been up to the average. It might have been thought that the extremely wet period of April and the first three weeks of May would have led to increased sales, but this has not been the case. The British seem as conservative as ever as regards their limited use of galoshes; there is only a run on them in times of heavy snowfall, and they are not used for rain, even in these days of expensive and often leaky boots. Of course galoshes are more expensive than they were, the ruling price to-day being 10 shillings for men's and 7 shillings, sixpence for ladies'. A large number of these are Canadian, which seem to have ousted the American brands so well known in pre-war days. I am told that the American are now too expensive and also that the high price of the Canadian is due to freight and duty, or at any rate to costs over and above those of manufacture. The price of the Canadian and British galoshes is the same.

RUBBER GROWERS' ASSOCIATION PRIZES.

The Rubbers Growers' Association, Inc., London, offers prizes amounting to £5,000 for new ideas and for encouraging new uses of rubber; a first prize of £1,000, three prizes of £500, and ten premiums of £100 each. A sum of £1,500 in addition will be divided among other competitors who may offer ideas of value. Suggestions must be in by December 31, 1920. They must be practical and likely to increase the demand for the raw material.

Competitors are required to give: (1) a brief description of the idea; (2) a full, detailed description, with explanations, samples, diagrams and designs, so as to make it possible to work out the idea; (3) a statement of the facts on which the idea is based and of the special advantages the competitor has had for acquiring his knowledge; (4) any available information about cost, demand and the quantity of raw rubber likely to be needed; (5) whether the idea is partly or wholly original or not; and (6) whether it is covered in any way by patents or if patents have been applied for.

Entries should be addressed to The Rubber Growers' Association, Prize Competition, care of Fitzpatrick, Graham & Co., 95a Chancery Lane, London, W. C. 2.

FOREIGN TARIFF NOTES.

LITHUANIA admits crude rubber free of duty, but imposes a duty of 20 per cent ad valorem on india rubber products.

Malta's new preferential tariff in favor of Great Britain reduces the 15 per cent ad valorem duty on all rubber goods, now in force, to 10 per cent, for those of British manufacture.

France (April 23) forbids the importation of dress shields, suspenders, garters and belts; manufactures with mountings of rubber or celluloid, and fountain pens.

Australia's revised tariff, in force March 25, 1920, permits the free importation of crude, waste, reclaimed, and masticated rubber; hard rubber in sheets, rubber thread and elastics. It increases the duty on rubber belting, hose, mats, druggists' sundries, other manufactures of rubber and rubber substitutes, and tires and tubes to 40 per cent ad valorem; but pneumatic tires weighing 2½ pounds or over and tubes weighing one pound or over must pay 2s. 6d. a pound, if that amounts to more than the ad

valorem duty. The preferential rates for British manufactures are 25 per cent. For rubber shoes the duty is 35 per cent, preferential 25 per cent; for rubber boots 10 per cent, British free. Insulated wire and cables 15 per cent, British free.

The Serb-Croat-Slovene State, of Yugoslavia, on March 19, 1920, prohibited the importation of rubber or part rubber boots and shoes, floor cloths and mats, toys and articles of soft or vulcanized rubber, hard rubber or gutta percha, or wholly or partly covered, coated, or saturated with rubber, if combined with the finest materials or precious metals.

Austria requires an export license for raw, reclaimed, or waste rubber, and for pneumatic tires and insulated wire and cables.

Germany, since February 28, 1920, requires licenses for the exportation of crude and purified rubber, gutta percha and balata; rubber, gutta percha and balata scrap and waste; and rubber substitutes. Furthermore for all manufactures of rubber, or partly of rubber export licenses are required.

Persia and Great Britain have formed a new commercial agreement which went into effect April 2, 1920. By it crude rubber enters Persia free; if prepared, in slabs, sheets or threads, it pays a duty of 3 kran a batman (21 cents on 6½ pounds). Rubber shoes pay 5 kran (35 cents) a batman, but if the rubber is combined with textiles which are more valuable than the rubber, the shoes rank as clothing and pay 15 per cent ad valorem. Tissues covered with rubber pay 10 per cent, and all other manufactures, including tires for bicycles or vehicles, 12 per cent ad valorem. All these goods must pass through specified custom houses, except by special permission.

EUROPEAN NOTES.

PIRELLI & Co., of MILAN, ITALY, made net profits of 5,420,000 lire in 1919, paying dividends of 55 lire per share. The company has decided to increase its share capital from 40,000,000 lire to 60,000,000 lire. One lira equals \$0.193.

A cable manufacturing company has been started at Södertälje, not far from Stockholm, Sweden, by the A. B. Svenska Maskinverken with a share capital of 18,000,000 kronor, the mother company retaining 8,000,000 kronor of the amount. A krona equals about \$0.27 United States currency.

France imported 32,455 metric tons of rubber in 1919 as against 19,927 tons in 1918, the values being 216,130,000 francs in 1919 and 113,578,000 francs in 1918. Of this amount 12,638 tons came from English ports, 3,235 tons from Brazil, 516 from French Congo, 321 from Senegal, 1,000 from the west of Africa, 8,264 from the British Indies and 6,481 tons from other countries. Besides this 11,722 tons of manufactured rubber goods were imported in 1919, including tires, tubes, shoes, clothing, bandages, tubing and so on, worth 221,134,000 francs. A large proportion came from the United States.

American automobile tires are in demand in Constantinople, the prices, even at the present rates of exchange, being apparently no obstacle. Salesmen who could not sell tires in France have disposed of them in the Turkish capital.

Kan & Kan, dealers in rubber, asbestos, etc., have removed from Doetinchem, to 17 Utrechtsestraat, Arnhem, Netherlands.

The India Rubber Products Co., Limited, 47-48 Farringdon street, London, E. C. 4, a branch of the United States Rubber Co. and associated companies, has now registered for the future conduct of its business as the "United States Rubber Co., Ltd." Other offices are maintained at Birmingham, Liverpool, and Glasgow.

Rubber was honored by King George V. through the inclusion, among the birthday honors for this year, of knighthood for Sir Henry Alexander Wickham, who forty-odd years ago, conveyed from Brazil to England the seeds of *Hevea* which were used to start the Ceylon and East Indian rubber plantations.

NETHERLAND INDIES NOTES.

RUBBER ACREAGE IN THE DUTCH EAST INDIES.

A VERY CAREFUL INQUIRY into the acreage devoted to rubber in the Dutch East Indies in the year 1918 has been made by the Trade Division of the Department of Agriculture, Industry and Commerce ("*Landbouw, Nijverheid en Handel*"), Netherlands India officially is divided into two parts, "Java and Madura" and "the Outer Possessions," which latter include Sumatra, Borneo, Celebes, New Guinea and the lesser islands of the East Indian archipelago. The investigators, for scientific reasons, distinguished between the estates devoted to rubber alone and those which raised mixed crops, and also took account of the different kinds of rubber trees planted. The figures follow, areas being given in hectares:

	NUMBER OF ESTATES	PLANTED AREAS	PRODUCTIVE AREAS	HECTA- RES SILICIES	FIGUS ELASTICA	MANI- HOT.
I. Planted With Rubber Only.						
Java	76	28,629	20,940	28,041	427	161
Outside	161	109,398	76,571	108,703	695	...
II. Rubber and One Other Crop.						
Java	50	11,390	5,696	10,239	634	517
Outside	50	21,802	13,481	20,829	973	...
III. Rubber and Two Other Crops.						
Java	11	1,001	388	933	34	14
Outside	10	4,713	2,021	4,484	231	...
IV. Rubber and Three or More Other Crops.						
Java	6	343	97	343	231	14
V. Mixed Crops.						
Java	81	29,727	25,411
Outside	63	16,723	5,333

1122 on east coast of Sumatra.

Of the above number of estates with mixed crops, there were 152 in Java and 39 in the outside possessions which had areas planted to rubber only. The figures for these pure rubber acreages were:

	NUMBER OF ESTATES	PLANTED AREAS	PRODUCTIVE AREAS	HECTA- RES SILICIES	FIGUS ELASTICA	MANI- HOT.
Java	152	31,923	25,572	29,298	2,440	190
Outside	39	14,807	9,324	13,278	1,029	...
Totals of Tables I-V.						
Java	393	121,000	53,442	38,330	1,326	706
Outside	284	152,238	97,405	134,016	1,899	...
Dutch East Indies	677	273,338	149,847	172,346	3,225	706

The average size of an estate devoted solely to rubber was 376.7 hectares (930.45 acres) in Java and 679.5 hectares (1,678.4 acres) in the outside possessions. Wild rubber, jelutong, gutta percha and the like are not included in the survey, which deals purely with cultivated plantation rubber.

FAR EASTERN NOTES.

THE MARKET for bicycle tires in Japan is probably greater than in any country of equal population. Not many Japanese can buy automobiles or motorcycles, but nearly every one can afford the cheap bicycles made in Japan. The imports of tires, which amounted to \$519,330 in 1913, were \$559 in 1918; the cause is the cheapness of the domestic article—the cheapest tires cost \$2.65 and the dearest \$6.50, while imported tires must pay a duty of \$4.75 on 100 pounds.

The Japanese rubber plantations in Malaya are chiefly in the State of Johore and are about 93,803 acres in extent.

Burma's exports of rubber during the war years and since have been as follows: 1919, 4,149,242 pounds, valued \$1,520,935 American money; 1918, 2,634,380 pounds (\$1,381,943); 1917, 2,301,157 pounds (\$1,425,244); 1916, 1,285,984 pounds (\$895,611); 1915, 987,392 pounds (\$632,594). Of this 67,365 pounds, valued \$13,659, were sent directly to the United States in 1919, and 76,246 pounds (\$46,623) in 1918.

Motor trucks are coming into general use in Singapore to convey plantation rubber from wharves to stores or from one

go-down to another. Auction sales are made subject to delivery within two days, which makes trucks almost a necessity, as the bullock carts are slow and carry only limited loads.

A Norwegian company, the Norsk Sumatra Co., with a capital of 1,800,000 kroner, has undertaken rubber planting in Sumatra.

The oldest rubber plantation in Cochin China was started in 1897, but the large estates date only from 1907. At present there are 49,400 acres planted in Cochin China and about 2,470 acres in the rest of Indo-China; the area is increasing by about 2,500 acres a year. The soil and climate are suitable, labor is plentiful, but capital is lacking.

Ceylon proposes to forbid the importation of all *Hevea* seed from any part of South America, owing to reports that leaf disease is common on the Amazon, as well as in Surinam and British Guiana, where it has practically killed rubber growing. In this it follows the lead of the Federated Malay States, which have prohibited the importation of seed from British Guiana since 1917. The leaf disease was brought to Surinam from Brazil about ten years ago.

Rubber in the Sultanate of Brunei in British Borneo is the chief crop raised for exportation. The business has been in a critical condition since 1918, owing partly to the fall in the price of rubber and partly to the lack of labor. The Brunei native is a good worker, but he takes to fishing or to work in the woods rather than tilling the soil, and, further, does not like to go far from home. The future of rubber depends on the importation of labor, coolie or other, from abroad.

The Selangor Rubber Co., one of the pioneer British rubber companies in the Malay peninsula, is now 21 years old. In 1899, when the bicycle boom was in full swing, but more than twenty years after Wickham had brought the *Hevea* seed from Brazil and Hooker and his assistants had demonstrated how well it could grow in Ceylon, Malaya and Southern India, the company took up 200 acres planted with trees one year old. It now possesses about 2,700 acres and fifteen years ago owned nearly twice as much land. It has turned out over seven million pounds of rubber, worth £1,140,000.

British North Borneo exported 8,801,795 pounds of rubber in 1919, being 50 per cent more than in 1918.

New Zealand expects to provide asbestos for its own needs from native sources. Large deposits of asbestos and of French chalk exist at Takala in Nelson province and also near Matucka.

A British combination of tire manufacturers is planning to build a tire and rubber goods factory at Howick in Natal and to amalgamate with itself the South African Rubber Manufacturing Co., of Johannesburg. It will be a year before they can get to work as the machinery must be sent out from England.

From an estate of 107 acres in Selangor (Federated Malay States), the Tremelhye Rubber Company reports a yield of 705 pounds of rubber per acre for 1919.

AFRICAN NOTES.

IN SOUTHERN NIGERIA many of the Pará rubber trees planted under government supervision have reached tapping age. In the Benin district 250,000 *Hevea* trees have been planted. The export for 1918 amounted to 352,504 pounds, most of it Pará rubber.

Rubber in Uganda is displacing coffee on some plantations; 11,255 acres, with coffee as a side crop, have been planted with Pará trees by European owners. The exports of rubber in 1918 were 255,063 pounds, valued at £12,893; in 1917 they were 108,336 pounds, worth £9,867. The natives also have planted some Pará and a considerable quantity of Ceará.

In Italian Somaliland the raising of *Manihot glaziovii* has begun.

Former German East Africa exported in the fiscal year 1918-19 344,700 pounds of rubber, worth 164,534 rupees.

In 1918 Mozambique exported £1,212 worth of rubber, most of it going to the United States.

In 1913 no American motor car could be found in French West Africa; by the end of 1919 there were 150 passenger automobiles, 80 motor trucks and 15 motorcycles. They are distributed as follows:

	Automos.	Trucks	Motor-cycles
Senegal	87	1	1
Upper Senegal and Niger	12	11	4
Ivory Coast	26	6	6
Palmery, French Togoland and the Kamerun ..	25	24	15

SOUTH AMERICAN NOTES.

IN ARGENTINA an exposition of North American manufacturers will be held in November next, in the buildings of the Sociedad Rural in Palermo, Buenos Aires. It is designed to bring the attention of South Americans to the products of the United States and has the support of the Chamber of Commerce of the United States in the Argentine Republic.

BRAZILIAN EXPORTS OF RUBBER FOR 1918 AND 1919.

From—	1918.	1919.	To—	1918.	1919.
Manaos	8,262	14,037	Germany	1	1
Itacoatiara	112	112	Argentina	127	61
Pará	13,525	17,764	Belgium	22	22
Ilha	47	96	Denmark	7	7
Maranhão	16	42	United States	17,886	23,299
Fortaleza	147	485	France	971	2,556
Recife	19	48	United Kingdom ..	3,341	6,769
Bahia	234	334	Italy	88	1
Rio	82	87	Spain	68	1
Santos	68	48	Portugal	32	32
Corumbá	272	247	Sweden	15	15
			Uruguay	179	161
Total	22,662	33,252	Total	22,662	33,252

	Average for 5 Years Before War.	Average for 5 War Years.	1918.	1919.
Totals in tons ..	38,525	31,367	22,662	33,252
Value in centos ..	260,473	123,868	73,728	105,537
Value in £1,000 ..	17,020	6,615	3,998	6,240

Of total exports of 33,252 tons in 1919, 53.5 per cent were shipped at Pará, 42.3 per cent at Manaós, 0.4 per cent at Itacoatiara and Ilha, and 4.2 per cent at sundry ports.

BRAZILIAN RUBBER EXPORTS DECLINE.

The total shipments of crude rubber from the ports of Pará, Manaós, and Itacoatiara, Brazil, and Iquitos, Peru, are decreasing, as is shown in the following table:

	1918.	1920.
January	6,649,915	6,273,039
February	9,242,309	8,162,264
March	9,512,787	6,916,352

The price of this commodity continues to be low, and the effect of the low price is seen in the refusal of merchants to place large orders for forward delivery.

RUBBER DORMANT IN DUTCH AND BRITISH GUIANA.

By Our Regular Correspondent.

IT WAS IN 1910-11, during the great rubber boom, that Dutch Guiana contracted rubber fever. Rubber planting was the topic of the day in those days; fortunes were to be made and speculation ran high. The demand on the Agricultural Department for seeds could hardly be met; thousands upon thousands were imported from Ceylon and other rubber-producing countries by the Government and sold to planters and others interested in this enterprise. The result of all this is too well known to readers of THE INDIA RUBBER WORLD, and, although the expected fortunes were not realized, still the great boom has done Dutch Guiana a good turn and who knows what the future has in store for the colony. Rubber is bound to make good. All that is required is cheap production and that will eventually come.

Rubber production in British Guiana is practically at a standstill at the present time, as the foreign market hardly makes its collection a profitable undertaking. It is doubtful that the col-

lection of rubber under existing conditions will pay. The trees are there either to be tapped unprofitably or allowed to remain untapped—preferably the latter course, until there is a greater demand for rubber and improved labor conditions make its collection a profitable concern. There is at present a greater demand in London for balata than for rubber, which brings only two shillings and three pence a pound. With the present high price of labor, it is impossible for the colony to compete against the rubber-producing countries in the East.

The presence of rubber leaf disease in the British colony is also a serious factor in the conditions operating against the production of rubber. Last year the Consolidated Rubber & Balata Estates, Limited, reported only a very small quantity of rubber from their plantations, owing to the severe attack of leaf disease from which the trees had not recovered. Considerable money was spent to eradicate the disease, but without success, and new planting was abandoned. The leaf disease is still causing a great deal of trouble and adds to the already high cost of production.

While there is little or no rubber activity at present in British Guiana, there is no reason to consider the industry altogether dead. After the great rubber boom between 1910 and 1911 the production dropped considerably in 1912, when only 216 pounds were exported, but the output rose to 1,340 pounds the following year, dropped to 1,107 pounds in 1914, and rose again in 1915 to 4,603 pounds. The export figures went as high as 15,586 pounds in 1916, dropped to 14,781 pounds the following year and reached their highest—23,854 pounds—in 1918. Although conditions were not very favorable in 1919, the total export of rubber from British Guiana was the second largest within the eight years under review, amounting to 17,793 pounds. During the first four months of this year 4,760 pounds were exported. The figures quoted do not seem to justify the view that the industry is abandoned.

It has been successfully demonstrated by experimental plantings in British Guiana that large areas are eminently suitable for the cultivation of Pará rubber. Tapping the Pará rubber trees found in the colony was begun in 1910 on two estates on the Demerara river. The quality of the rubber was good and it was valued very highly in the London market. Since then there has been a general disposition in British Guiana to plant *Hevea brasiliensis*.

The cost of rubber cultivation also had special attention and investigation by the Department of Science and Agriculture in 1911, when, on flatlands which required to be thoroughly drained and cultivated, the cost was estimated to be from \$65 to \$70 per acre during the first year, with an annual expenditure of from \$25 to \$30 per acre in subsequent years.

There are extensive rubber cultivations in British Guiana and it is regrettable that tapping operations on a large scale cannot proceed, owing to the labor conditions and the unremunerative rubber market.

In Dutch Guiana the labor question is practically settled, for large numbers of Javanese are arriving, and these are expert tappers and best adapted for rubber enterprises.

It is to be hoped, however, that both British and Dutch Guiana in the course of time will become large rubber producing countries.

BALATA NOTES FROM DUTCH GUIANA.

The year 1919 closed with a fairly satisfactory export sheet. The balata exported to the outside world and produced under the most trying circumstances has proved that the colony is still a valuable asset to the Netherlands.

The balata exported amounted to 493,907 kilos, of which 38,348 kilos was sent to Holland, 138,302 to the United States, 40,899 to France, 259,290 to England, 8,097 to other countries.

The importations from the United States reached the high figure of \$4,313,101, and the total value of exports to that country

from Dutch Guiana was 2,015,505 florins or approximately \$900,000.

Since the beginning of the year balata gathering has been taken rather seriously. Many large expeditions left Paramaribo for the several districts and should the weather be favorable the crop for 1920 will be a record one. There is everything at hand to make the crop of 1920 a success; the provisions from the United States are pouring into the country regularly now; the men to operate the trees are there; the money to pay them for their work is in the bank and, last but by no means the least, the trees from which the balata is gathered are in abundant evidence.

CHICLE GUM IN BRITISH GUIANA.

Announcement has been made in a report submitted by Consul McCunn of the discovery of chicle-producing trees in British Guiana. Prospecting expeditions sent into the interior have recently returned to Georgetown with fully 600 pounds of chicle, and preparations are now being made by the discoverer, who holds a concessional right over 6,200 square miles of territory, to send out four prospecting parties in order to continue investigations and ascertain the capacity of the tract. Territory thus far examined is reported to be capable of yielding 200,000 pounds of gum annually.

THE PRESENT STATUS OF LONG-STAPLE COTTON.

SOME INTERESTING INFORMATION on the long-staple cotton in the United States is imparted by the Department of Commerce in Bulletin No. 140 of the Census Bureau on "Cotton Production and Distribution." The years given are generally the "growth" years for cotton, which lap over the following calendar year.

The need of long-staple cotton for the manufacture of thread, automobile tires, and high grade fabrics has caused the demand to far exceed the production. There was a time when the long-fiber Sea Island cotton grown in the West Indies formed the greater part of the cotton used in Europe; the whole world product of this variety at present, about 50,000 bales, is comparatively insignificant. The quantity of long-fiber cotton produced in Egypt last year was about 900,000 bales, and the quantity of upland and American-Egyptian cotton with a staple of $1\frac{1}{4}$ inches or more in length produced in the United States was 1,394,000 bales. Long-staple cotton is also produced in relatively small amounts in India, Brazil, Peru, and some other countries. The amount of long-staple cotton, that is, cotton having a fiber of $1\frac{1}{4}$ inches or more in length, produced in the world in the growth year 1918 probably did not exceed 2,500,000 bales.

SEA ISLAND COTTON.

The Sea Island cotton crop of 1918 amounted to 52,208 bales or 20,450,000 pounds gross weight, being 40,411 bales less than the previous crop and 65,351 bales less than the 1916 crop. The reduction is due to the ravages of the boll weevil and to the consequent reduction in acreage cultivated on that account. Where they stick to cotton, the farmers plant early maturing upland varieties instead of Sea Island, which takes long to ripen. The best Sea Island in the United States is grown on the islands off the coast of South Carolina; it is also grown in Georgia and in Florida.

AMERICAN-EGYPTIAN COTTON.

The imports of Egyptian cotton into the United States in the fiscal year ended July 31, 1919, amounted to 100,006 bales of 500 pounds each, compared with 114,580 bales for 1918, 199,892 bales for 1917 and 350,796 bales for 1916. The demand for Egyptian cotton led to its being grown in the United States; and its culture has been established in Arizona and California. The Department of Agriculture reports on its cultivation:

"The production of American-Egyptian has greatly increased owing to the decline in the production of Sea Island cotton, caused by the ravages of the boll weevil in the southeastern

states. While not as fine as the best Sea Island fiber, American-Egyptian of the Pima variety is fully equal to most of the Sea Island crop in the length of staple and in average breaking strength. It seems to be a satisfactory substitute in making the classes of goods for which Sea Island was formerly used. The increase in the manufacture of automobile tires and the difficulties in the importation of Egyptian cotton, point to a strong demand for American-Egyptian and a corresponding increase in production."

During the calendar year 1918 about 80,000 acres of irrigated land in Arizona and California were planted with this cotton and the crop amounted to about 40,000 bales of 500 pounds which was sold at an average price of 56 cents a pound. At least 80 per cent of this was Pima, which has an average length of staple of from $1\frac{1}{4}$ to $1\frac{3}{4}$ inches. The acreage planted in 1919 is about 90,000 acres, nearly all located in the Salt River Valley, Arizona, and almost all of it is Pima.

LONG-STAPLE UPLAND COTTON.

The long-staple upland cotton was formerly grown only in the Mississippi delta. The increased demand has caused successful attempts to be made to grow it in other parts of the cotton belt. In 1918 there were grown 1,359,000 bales of upland cotton, $1\frac{1}{4}$ inches or more, as compared with 1,354,000 bales in 1917, 1,009,000 bales in 1916, and 832,000 bales in 1915. The increase in long-staple production is due, first, to the high prices paid for it in recent years, and second, to improved varieties, which, on the right soil, are showing themselves equal in yield and in early maturity to the short-staple cotton. It was found that 1.5 per cent of the crop was over $1\frac{1}{4}$ inches in length, the percentage in Mississippi being 5.4. The yield per acre is put at 190 pounds of lint above $1\frac{1}{4}$ inches in length, and 182 pounds from $1\frac{1}{4}$ to $1\frac{3}{4}$ inches, compared to the 157.5 pounds of short-staple under $1\frac{1}{4}$ inches. The long-staple varieties are grown only on better soil and by farmers who give their crops special attention. The states which produced the most long-staple upland cotton in 1918 were Mississippi, Arkansas, Texas, and South Carolina.

CANADIAN NOTES.

The Ames-Holden Rubber Boot Co., Limited, the new subsidiary of the Ames-Holden-McCreedy System, Montreal, Quebec, will locate its factory at Kitchener, Ontario, where it has acquired the Orphanage property at the corner of King and Wilmot streets and adjoining land, opposite the plant of the Ames-Holden Tire Co., Limited. T. H. Rieder is president of the new concern.

The B. F. Goodrich Co. of Canada, Limited, has opened a new branch at 44 Princess street, Winnipeg, Manitoba, and another at Dewdney avenue and Angus street, Regina, Saskatchewan.

K. & S. Tire & Rubber Goods, Limited, Weston, Ontario, will locate its new plant on Paton road, Toronto, Ontario. New machinery of the latest type will be used, especially in the rubber sundries department where production is especially desired to meet the increasing demand. The company also expects to build a new structure at an early date, in addition to those already acquired in Toronto.

The Dunlop Tire & Rubber Goods Co., Limited, has obtained a permit to build a \$15,000 brick factory at the corner of Queen street and Booth avenue, Toronto.

At the Shoe, Leather and Allied Trades Fair, to be held in Montreal July 13-17, 1920, the following rubber companies and concerns in allied lines have secured booths: Ames-Holden-McCreedy, Limited, Montreal; Canadian Consolidated Rubber Co., Limited, Montreal; Columbus Rubber Co., Limited, Montreal; Goodyear Tire & Rubber Co., Limited, Montreal; Scholl Manufacturing Co., Toronto; and the United Shoe Machinery Co. of Canada, Montreal.

R. W. Ashcroft, director of publicity for the Ames-Holden-McCreedy System, has been elected president of the Montreal Publicity Association for the ensuing year.

The W-S-M Hydraulic Press Vulcanizers

The Wellman-Seaver-Morgan Company offers prompt delivery on Hydraulic Press Vulcanizers.

These Vulcanizers are built in all sizes—from the ones used in curing the smallest pneumatic casing to those used for the largest solid or cord pneumatic tires for motor trucks. Cylinders can be supplied for any hydraulic pressures and shells for any steam pressure within practical limits.

The Wellman-Seaver-Morgan Company is especially well equipped for manufacturing this class of machinery, as it has its own pattern shops, steel and iron foundries, boiler, structural and machine shops—each of which is equipped with modern machinery for efficiently handling its part of the work. There is a decided advantage in having all parts of a vulcanizer built by one manufacturer.

The Wellman-Seaver-Morgan Company manufactures a complete line of rubber machinery. Bulletins or engineering data concerning this equipment will be sent on request.

The Wellman-Seaver-Morgan Co.
CLEVELAND, OHIO

Manufactured and sold in Canada by
Canadian Ingersoll-Rand Co., Limited
260 St. James Street
MONTREAL

- 140,119. The covering for petrol tanks for aircraft, described in specification No. 140,118, modified by substituting vulcanized rubber sheets for those of rubbered cloth. Dunlop Rubber Co., 14 Regent street, London.
- 140,120. Fuel tanks having self-sealing walls, lined with balata, gutta percha, etc. Dunlop Rubber Co., 14 Regent street, London.
- 140,148. Demountable rim for tires. Crimston Tyres, Limited, and J. C. Cooper, St. Albans, Hertfordshire.
- 140,159. Self-tilting fountain pen. W. J. Crowe, Granville, Canadian Self Hospital, and J. W. Smith, 20 Victoria Park—both in Buxton, Derbyshire.
- 140,202. Catamenial appliance with outer casing of rubber. E. I. M. Gayer, 19 Green street, Charing Cross Road, London.
- 140,214. Shaving brush, provided in center of bristles with a vacuum cup or massaging device of rubber, etc. W. M. Hoskins, Carnethy, Elmton Road, Accrington, Lancashire.
- 140,240. Sock suspenders. Sir S. Faire and Faire Bros. & Co., Rutland street, Leicester. (Refers to specification No. 110,741.)
- 140,246. Hollow metal stud with vulcanite covered head, for holding a soft rubber suction disk in place on a denture. H. M. Parsons, 46 Follywell street, Blackburn.
- 140,248. Valve for pneumatic tire. North British Rubber Co., Castle Mills, and C. Hubbard, 46 Newforth Terrace—both in Edinburgh.
- 140,269. Spring wheel with rubber tread vulcanized to continuous outer rigid ring and having pneumatic tire within. A. E. Jennings, Owensboro, Kentucky, U. S. A.
- 140,302. Rubber soles for shoes, etc., provided with non-skid projections arranged so as not to form a defined pattern. J. J. Hartopp, Rutland street, Leicester.
- 140,316. Surgical dressing apparatus. F. R. Arnett, 404 North Fifth street, Philadelphia, U. S. A.
- 140,337. Construction of vulcanized rubber patches as protectors for shoe soles, etc. H. C. Ridout, 28 The Triangle, Bournemouth, Hampshire.
- 140,338. Jacket and cover for tire with rim enclosing air tube. J. Jack, Llyllyae, Copland Road, Govan, Glasgow.

ISSUED MAY 19, 1920.

- 140,501. Detachable rim for tires on disk wheels. Dunlop Rubber Co., 14 Regent street, Westminster, and C. Macbeth, Para Mills, Aston Cross, Birmingham. (Refers to specification No. 121,757.)
- 140,502. Detachable rim for tires on disk wheels. Dunlop Rubber Co., 14 Regent street, Westminster, and C. Macbeth, Para Mills, Aston Cross, Birmingham. (Refers to specification No. 121,757.)
- 140,564. Windshield of vehicle window cleaner. W. Faint, 7 Waterloo street, Birmingham.
- 140,583. Gutta percha printing blanket. G. Ruthven, Maitland Park, Burnhead, Larkhall, Lanarkshire.
- 140,623. Double-ended inner tube with main and reserve air chambers having separate inflating valves. R. B. Lemming, 41 St. Peterstraede, and C. F. E. Baden, 25 Dronningens, Tvaergade—both in Copenhagen.
- 140,628. Puncture detectors for pneumatic tires, air cushions, etc. A. H. Browne, 55 Montagu Road, Hendon, London.
- 140,658. Rubber coated catgut for tennis rackets. S. G. Lewis, Greensburg, Pa., U. S. A.
- 140,659. Life-saving costume with inflatable tubes. E. C. R. Marks, 57 Lincoln's Inn Fields, London.
- 140,673. Neck tie with lining of swansdown coated on one side with rubber solution. A. J. De La Lande, 33 Virginia street, Glasgow.

NEW ZEALAND.

ISSUED APRIL 8, 1920.

- 41,526. Sponge rubber cap for scalp treatment. G. Curtis, Palmerston North, N. Z.
- 42,960. Douche nozzle. Dilator Syringe Foreign Rights Corporation, 42 Broadway, New York City, assignee of J. Rose, 729 Halsey street, Brooklyn—both in New York, U. S. A.

ISSUED APRIL 22, 1920.

- 42,768. Auxiliary pneumatic or solid rubber tire traveling around same axis as primary pneumatic, to provide auxiliary rolling surface if primary pneumatic becomes accidentally deflated, and also to guard against bursting of primary pneumatic. G. Englebert, Fils & Co., 311 rue des Vennes, Liege, Belgium.

GERMANY.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 322,469. (May 28, 1919.) Resilient tire. August Sebold, Fürstenwalde, 322,837. (December 27, 1914.) Nursing nipple. Carl Cade, Berlin.
- 323,275. (May 9, 1919.) Resilient wheel. Friedrich Bussmann, Berlin-Fankow.
- 323,394. (September 25, 1918.) Resilient tire. Max Greiner, Charlottenburg.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 502,611. (August 13, 1919.) Elastic tire. Demontable Spring Tire Co. (December 28, 1916.) Improvements in resilient tires. A. Delaunay-Bellevue.
- 502,685. (April 21, 1917.) Resilient wheel that does away with need of springs for body. J. Tavel, Vaulnauy le Haut (Isere.)
- 502,829. (August 19, 1919.) Improvements in pneumatic tire cushions. S. Mizushima.
- 502,855. (August 1, 1919.) Automobile tire sections, with constant resilience. J. Bulloz, Annecy, (Haute Savoie).
- 503,029. (August 25, 1919.) Auxiliary detachable casing for pneumatic tires. G. A. Collet.
- 503,138. (August 27, 1919.) Improvements in fabric used for making balloons and dirigibles. The North British Rubber Co., Ltd., Glasgow.

TRADE MARKS.

THE UNITED STATES.

- N 114,432. The words COUNCIL, Oak above representation of an acorn in which the acorn is surrounded on the sides by three interlinked links—rubber and rubber and fabric tires and tubes. R. B. Piper, Sioux City, Ia.
- 115,140. The word FORTKAL superimposed upon a double-outlined circle bearing the words MORON FABRICS—waterproof automobile top and certain material, etc. The W. J. Donnelly Co., Detroit, Mich.
- 116,005. The word NUTSOM—woven and braided elastics, garters, armbands, etc. The Narrow Fabric Co., Wyomissing borough, near Reading, Pa.
- 117,657. Representation of a white above the word VIOLET—elastic webs. Faire Bros. & Co., Limited, Leicester, England.
- 117,659. Representation of snowdrops and the words THE SNOWDROP—classic webs. Faire Bros. & Co., Limited, Leicester, England.
- 118,389. Representation of airplane propeller, superimposed upon double-outlined circle—toy airplanes. Lawrence Airplane Model and Supply Co., Chicago, Ill. (See THE INDIA RUBBER WORLD, October 1, 1919, page 30.)
- 121,788. The words PORCUPINE BOOT on a scroll above representation of a porcupine—tire patches and inner liners. E. M. Steel, assignor to Porcupine Manufacturing Co.—both of Spokane, Wash.
- 123,617. The word WEDGE—rubber erasers. Joseph Dixon Crucible Co., Jersey City, N. J.
- 124,922. The word WALRUS—arctics. United States Rubber Co., New Brunswick, N. J., and New York City.
- 126,571. The words GIANT MATCH—billiard cushions. The B. F. Goodrich Co., New York City.
- 126,587. The word AUCKLAND—rubber or rubber and fabric tires and tubes. McClaren Rubber Co., Charlotte, N. C.
- 127,159. A circle enclosing the words THE E. Z. MEN'S GARTER—garters. The Thos. F. Taylor Co., Bridgeport, Conn.
- 127,990. The letter A within outline of a spade spot—hard rubber pipe bits and cigar and cigarette holder. American Hard Rubber Co., Hempstead and New York, N. Y.
- 128,189. A seal bearing representation of Hermes and the words WISCO ATHLETIC—rubber and fabric shoes, multi of leather, rubber, and fabric in the various combinations of those materials. Wisconsin Shoe Co., Milwaukee, Wis.
- 128,428. The word EACOT—tank shoes. The Rubber Co., Trenton, N. J.
- 128,446. The word SNOOKERS—boots, shoes, slippers and sandals made of leather rubber, fabric and combinations of the same. J. H. Kelleher, New York City.
- 128,602. The words MAXHEIL—inhalers. Frederick Heilman Co., Johnston, Pa. (See THE INDIA RUBBER WORLD, January 1, 1920, page 124.)
- 128,848. The word HEATHER—rubber heels. The Lorain Rubber Heel Co., Lorain, O.
- 129,168. The word KUMPI—aprons. Brooklyn Shield and Rubber Co., Brooklyn, N. Y.
- 129,769. The word VICTORY—composition heels, soles and taps. The Marathon Tire & Rubber Co., Cuyahoga Falls, O.

THE UNITED KINGDOM.

- 393,554. The word SASHENA—rubber sheets, sanitary bandages and belts, included in Class No. 11. T. J. Smith & Nephew, Limited, 5 Neptune street, Hull.
- 395,156. Conventionalized representation of a roll of belting bearing the words DICK'S ORIGINAL BALATA GUTTA PERCHA & CANVAS BELTING and the words TRADE MARK—balata, gutta percha and canvas belting. R. & J. Dick, Limited, 23 McPhail street, Greenhead, Glasgow.
- 395,292. The word AVONIA within conventionalized sunburst as background for point of fountain pen in vertical position—fountain pens, erasers, etc. 10, Levl 9 Via Basiglio, Turin, Italy. (Care of Herbert Huddan & Co., 31-32 Bedford street, Strand, London, W. C. 2.)
- 395,772. The word GIANT within an oval—rag and rubber cutting machines. Taylor, Stiles & Co., Riggelsville, N. J., U. S. A. (Care of R. J. Marx, 133-139 Finsbury street, London, E. C. 2.)
- 395,958. Representation of a label bearing the words and letters L. P. L. PEPTOMINT GUM within a circle and diagonal polygon—chewing gum. L. P. Larson, Jr., Co., 201 East Ohio street, Chicago, Ill., U. S. A. (Care of Heron Rogers & Dehn, Bridge House, 181 Queen Victoria street, London, E. C. 4.)
- 396,184. Representation of a pyramid surmounted by a tire, accompanied by the words APEX RUBBER CO. TRADE MARK, all within a double-outlined circle—all goods included in Class No. 40. A. J. Miller-Smith, trading as The Apex Rubber Co., Laurel Cottage, Fox Hill, Upper Norwood, London, S. E. 19.
- 400,005. The words "ODDS ON" quoted—all goods included in Class No. 40. The "ODDS ON" Specifics Co., Limited, 36-37 Cock Lane, Snow Hill, London, E. C. 1.
- 400,009. The words "ODDS ON" quoted—all goods included in Class No. 49. The "ODDS ON" Specifics Co., Limited, 36-37 Cock Lane, Snow Hill, London, E. C. 1.
- 400,645. The word POPULAK in seal bearing the representation of a pair of balances and the words NORTH BRITISH RUBBER CO., LIMITED, EDINBURGH. The North British Rubber Co., Limited, Castle Mills, Fountainbridge, Edinburgh, Scotland.
- 400,910. The word ROVERS—footballs. John Douglas, Son & Co., Trindle Works, Trindle Road, Dudley, Worcestershire.
- 401,109. The word WASHBROOM—washing machines, and washers, and rubber hose. E. J. Little, trading as The West of England Motor Industries, Monmouth Place, Upper Bristol Road, Brompton, London, W. C. 2.
- 401,338. The word KELVINETTE—goods manufactured from india rubber or gutta percha, not included in classes other than No. 40. Sloan-Munroe & Co., Limited, 11-19 Queen street, Glasgow.

- 401,745. The word **GOODYEAR** divided by representation of a winged foot—goods manufactured from rubber and gutta percha, not included in classes other than No. 40. The **Goodyear Tire & Rubber Co., Akron, O., U. S. A.** (Care of Marks & Clark, 57-58 Lincoln's Inn Fields, London, W. C. 2.)
- 401,928. The word **VULCANIZING**—vulcanizing compounds. **Harvey Frost & Co., Limited, 148-150 Great Portland street, London, W. 1.**
- 401,929. The word **TREADING**—vulcanizing compounds. **Harvey Frost & Co., Limited, 148-150 Great Portland street, London, W. 1.**
- 401,930. The word **REPAIRING**—vulcanizing compounds. **Harvey Frost & Co., Limited, 148-150 Great Portland street, London, W. 1.**

THE DOMINION OF CANADA.

- 26,342. The word **VAC**—golf balls. **The Dunlop Rubber Co., Limited, Dunlop House, 1 Albany street, Regent's Park, London, N. W. 1, England.**
- 26,447. The word **EVERGREEN** on a shield above representation of an evergreen tree—inner tubes for automobile and bicycle tires. **Chapman (Canada) Limited, Montreal, One.**
- 26,493. The letter **C** surrounding the letter **X** and **V**-shaped devices—rubber boots and shoes and tires and tubes. **Converse Rubber Shoe Co., Malden, Mass., U. S. A.**
- 26,518. The word **MAJESTIC**—tires and tubes. **Majestic Tire & Rubber Co., Indianapolis, Ind., U. S. A.**

THE FRENCH REPUBLIC. TO AMERICANS.

- 187,015. The word **GOODRICH**—pneumatic or solid tires, belting, and all rubber articles. **Société Française B. F. Goodrich, Colombes, France.**
- 27,297. The letter **G** within laurel wreath, between two diamond shapes—rubber tires of all kinds and all rubber goods. **The B. F. Goodrich Co., 1780 Broadway, New York City, U. S. A.**
- 27,888. The words **ADAMS KAY**—chewing gum, etc. **The American Chiclé Co., New Jersey, U. S. A.**
- 27,890. The words **ADAMS SEN SEN**, with picture of ribbon—chewing gum, etc. **The American Chiclé Co., New Jersey, U. S. A.**
- 27,892. The words **ADAMS YECATAN**—chewing gum, etc. **The American Chiclé Co., New Jersey, U. S. A.**
- 23,893. The words **BREMAN'S PAPER**—chewing gum around portrait—chewing gum, etc. **The American Chiclé Co., New Jersey, U. S. A.**
- 27,958. The representation of a seal bearing the words **UNITED STATES RUBBER COMPANY AND ASSOCIATED COMPANIES** on edge and the words **U. S. RUBBER SYSTEM** in the center—all kinds of rubber articles. **United States Rubber Co., New Brunswick, N. J., U. S. A.**
- 27,994. The letters **A-W** within a diamond—apparatus for repairing belting or pneumatic tires, and all utensils, accessories, and needed detached parts. **The Williams Foundry & Machine Co., Akron, O., U. S. A.**
- 28,018. The word **ECONOMY** in a border—clogs of rubber, rubber composition and fiber for boots and shoes. **Emery Heel Sales Co., Boston, Mass., U. S. A.**
- 28,026. The word **SARCO** in white letters on a black diamond—insulating material of all kinds including rubber. **Standard Asphalt & Refining Co., Chicago, Ill., U. S. A.**
- 28,220. The word **MASON** within an oval, with a flourish—pneumatic, hollow, or solid tires and all casings. **The Mason Tire & Rubber Co., Kent, O., U. S. A.**

DESIGNS.

THE UNITED STATES.

- No. 55,114. Rubber sole pad. Patented May 11, 1920. Term 14 years. **J. E. Barney, New York City, assignor to Pioneer Products, Inc., Malone—both in New York. (See THE INDIA RUBBER WORLD, April 1, 1920, page 434.)**

- 4,784. Sole pad. Patented May 18, 1920. L. S. Mitchell, Montreal, Que.

Review of the Crude Rubber Market.

NEW YORK.

WHILE there has been much speculative activity, the regular rubber market has been very dull with few sales and the lowest prices of the year. This is due in part to the general tightness of money, which makes it difficult to finance even established business. The inability to procure credits has prevented dealers from taking advantage of the low prices in the East and securing stocks in anticipation of future rises. The continued difficulties of railroad transportation have interfered with manufacturers' receiving raw materials and delivering products, which has kept rubber prices down. An additional temporary cause for this has been the large proportion of moldy rubber found in some invoices. Manufacturers are holding back mainly because their stocks are sufficient for their needs under the present hampering conditions and also in the expectation that prices will be still lower.

Forecasts in the tire-building trade have been confused somewhat by the troubles of the fabric makers with transportation and with labor, and also by the long-continued bad weather this spring, which interfered with the use of automobiles and consequently with the anticipated demand for new tires.

Prices for plantation and South American rubber at the beginning and toward the end of the month are shown in the following quotations:

PLANTATIONS. June 1, first latex crepe, spot, 39 cents; July-September, 39½ cents; October-December, 43-43½ cents; January-June, 45 cents.

June 25, spot 38-38½ cents; July-September, 40½ cents; October-December, 43½ cents; January-March, 45 cents; January-June, 46 cents.

June 1, ribbed smoked sheets, spot 38½ cents; July-September, 39½ cents; October-December, 43-43½ cents; January-June, 44½-45 cents.

June 25, spot, 37¼-38 cents; July-September, 39½ cents; October-December, 43 cents; January-March, 43¼ cents; January-June, 44½ cents.

June 1, No. 1 amber crepe, spot, 38 cents.

June 25, spot, 36½ cents; October-December, 32 cents.

June 1, No. 1 rolled brown crepe, spot, 31 cents. June 25, spot, 30 cents; October-December, 32 cents.

SOUTH AMERICAN PARÁS AND CAUCHOS. June 1, spot prices, upriver fine, 39½ cents; islands fine, 40½ cents; upriver coarse, 30 cents; islands coarse, 22 cents; Cameté coarse, 22½-23 cents; caucho ball, 30¼ cents.

June 25, upriver fine, 37½ cents; islands fine, 40 cents; upriver coarse, 27 cents; islands coarse, 22 cents; Cameté coarse, 20½ cents; caucho ball, 28 cents.

RECLAIMED RUBBER.

Reclaimers are operating their plants on full schedules and report an active demand at no advance in prices. Transportation facilities are still in bad condition and deliveries are consequently made with difficulty. The mechanical factories of the large companies are working to capacity. In tire production output has been considerably restricted except possibly in cord tires.

NEW YORK QUOTATIONS.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert R. Beers, broker in crude rubber and commercial paper, No. 1 Liberty Street, New York City, advises as follows:

"During June the demand for commercial paper has been quite limited and entirely from out-of-town banks. Early in the month the best rubber names went at 8 per cent, but during the latter part of the month the rate advanced to 8 1/2 to 9 per cent; names not well known are practically neglected."

SINGAPORE RUBBER MARKET.

GUTHRIE & CO., LIMITED, Singapore, report [May 6, 1920]:

Influenced by advices of a fall in values in London and New York, the rubber market showed a pronounced weakness at the auction held yesterday and to-day. Buycing was on a very limited scale, and only the best of the lots offered elicited any competition. Ribbed smoked sheet sold up to 86 cents (one lot realized 86 1/2 cents), or 6 cents below last week's best. Only a very few lots were disposed of at this figure, the average for prime sheet being about 85 cents. Fine pale crêpe sold at up to 84 1/2 cents (three lots sold at 85, 85 1/2 and 86 cents, respectively), showing a drop on the week of 6 1/2 cents.

Low grade crêpe shared in the general decline and sellers had to make considerable concessions to meet the market. Of 699 tons offered only 366 tons were sold.

The following is the course of values:

	In Singapore per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked.....	83c @ 86c	2/1 1/2 @ 2/1 1/2
Sheet, good ribbed smoked.....	82 @ 82 1/2	2/1 1/2 @ 2/1 1/2

*Quoted in Straits Settlements currency: \$1 = \$0.567 United States currency.

ANTWERP RUBBER MARKET.

GRISAR & CO., Antwerp, report [May 28, 1920]:

The low prices reached by rubber seem to have attracted the attention of buyers and we note a better demand. After having touched the price of 1c. 10 1/4 d., the closing prices were: Latex crêpe, spot, 2s.; Para fine, 2s. 1 1/2 d.

At the last moment great firmness with good tendency is noted. Statistics for the week were as follows: Arrivals, 566 tons; sales, 1,170 tons; stock, 20,819 tons, against 21,799 in 1919.

Small quantities of African rubber were sold; 1,430 kilos of red Congo Wamba and 100 kilos of red Congo Kasai. Stock on hand: about 445 tons. Owing to the violent fluctuations in exchange the futures market was very active, and transactions amounting to 440,000 kilos were made. Closing quotations, each month: May-November, 11.70 francs; December, 11.60 francs; January-April, 11.50. Tendency steady.

AMSTERDAM RUBBER MARKET.

JOOSTEN & JANSSEN, Amsterdam, report [June 4, 1920]:

The rubber market has again been very quiet during the past week; the spot business has been going on, but on the terminal market the turnover has been small. Prices were a little firmer: Standard crêpe, spot Amsterdam, rose from f. 1.20 to f. 1.27. On the terminal market f. 1.30 was bid for Iuna crêpe, while June sheets were offered at f. 1.29; for standard sheets, August delivery, f. 1.29 has been paid. Toward the close the market was somewhat easier, as buyers withdrew their orders.

The next inscription sale on June 15 will comprise about 546,000 kilos, of which about 470,000 are fresh arrivals.

Totals.....	29,545	36,315	38,799

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official report from Singapore states that there were 15,720 tons of rubber (of which 1,264 tons were transshipments) exported from the ports of the Straits Settlements in the month of April. This compares with 5,931 tons in March and 10,848 tons in the corresponding month of last year. The total exports of rubber for the first four months of the present year amounted to 52,155 tons, compared with 61,821 tons for the similar period of last year and 22,078 tons in 1918. Appended are the comparative statistics:

	1918.	1919.	1920.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THE SITUATION in the rubber scrap market is described as easier. Tires and shoes are lower than last month. The market changes but slightly from week to week. The activity is not up to normal and the outlook is problematical. Prices quoted are nominal.

QUOTATIONS FOR CARLOAD LOTS DELIVERED.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

AMERICAN COTTON. The market has been quiet and steady with a little business done. Middling uplands stayed at 40 cents till the middle of the month, then declined slightly and gradually until it reached 38.25 cents at the time of going to press. Tight money and the raising of the rate of interest by the Federal Reserve Board, have contributed to this result. Reports on the new crop are conflicting as so much depends on the weather, owing to the lateness in planting on account of the hard winter. In some districts planters have turned to farm produce instead of cotton, because of the boll weevil and the high prices of vegetables; in others they are planting more cotton than before. It is too early to speculate on the amount of the new crop. Meanwhile conditions in England point to a diminution, if not a complete cessation, of imports of cotton from the United States.

SEA ISLAND COTTON. There is no change in the situation regarding Sea Island Cotton, and no signs of a cessation of the ravages of insect pests. Many planters have given up cotton for the time being or have cut down their acreage, as Sea Island cotton seems to have abdicated in favor of Arizona.

EGYPTIAN COTTON. Reports here are also conflicting. While information has been given out that a larger acreage than ever has been planted with cotton, owing to the high prices and the speculation of last season, equally positive is the assertion that the Government has insisted that a large proportion of the cotton land, two-thirds, should be planted with food stuffs.

ARIZONA COTTON. Every available foot of ground has been utilized and a record crop is anticipated, perhaps three times the 42,734 bales of last year. All of the crop has been contracted for by fabric manufacturers.

COTTON FABRICS. The difficulties in meeting the demands for tire fabrics have been relieved, partly by the congestion of transportation, which, by holding up steel, rubber and other raw materials, has forcibly reduced the manufacture of automobiles and of tires, and partly by desire to substitute cord tires for those made of square woven fabrics and the consequent cessation of the call for the latter. There is a great confusion about contracts, on this account and reluctance to give out quotations or terms of settlement.

The market for hose and belting fabrics is strong but the offerings are restricted. There is a rush to cancel contracts in drills, sheetings and osnaburgs, and the sales of piece goods at the mills have fallen sharply; the manufacturers, however, see no prospect of reducing prices.

THE MARKET FOR CHEMICALS AND COMPOUND-INGREDIENTS.

NEW YORK.

THE generally congested freight conditions still continue to hamper the distribution of stocks in all lines. Producers are endeavoring to keep their regular customers supplied, but are not seeking new business which would be only adding to their present difficulties. Prices generally have remained firm and unchanged with tendency to advance.

ANILINE OIL. The demand has been steady. Prices firm. Spot early in the month was 34 cents per pound.

BARYTES. Shipping facilities for miners of barytes showed slight improvement a few weeks ago, much to their encouragement. Attention is concentrated on back orders and quotations on future business are not being made.

BENZOL. Production continues far behind deliveries. Spot stocks are around 28 cents a gallon for the 90 per cent grade.

BLACKS. Business in blacks is maintained at an active and steady demand. Manufacturers of carbon black are harassed by legislation which has caused removal of plants to sections of the country far from the field of consumers, and, by the utilization of poorer qualities of natural gas. The demand from rubber manufacturers grows steadily and has reached very large proportions. The outlook certainly does not indicate any lowering in price in the near future.

FABRICSJENCKES
SPINNING
COMPANYPAWTUCKET
RHODE ISLAND

AKRON OFFICE

407 Peoples Savings & Trust
Co. Building.

CARBON BISULPHIDE. The demand is good with spot prices varying from 7 1/4 to 8 cents.

CARBON TETRACHLORIDE. This material is in good demand and the price holds rather firm and steady.

DRY COLORS. Throughout the past month trade and prices have continued strong.

LITHARGE. Demand on all lead and zinc products far exceed the supply which in the Eastern section of the United States has been practically depleted, owing to inability of the railroads to move shipments from the Western producers.

LITHOPONE. Many manufacturers are actively engaged in preparing for an increase of production due to the excessive demand. The producers are endeavoring to supply old customers but with indifferent success, owing to the railroad situation. The price remains nominally unchanged at 8 cents.

SUBLIMED LEAD. The same conditions of overdemand and short supply prevail in all lead products. Sublimed lead is under the same influences that affect litharge.

SULPHUR. The market situation of sulphur remained practically unchanged during the month, both as to price and steady demand.

WHITING. Chalk has been arriving in slightly increased amount but the whiting supply is exceedingly short and prices firm.

ZINC OXIDE. Producers of zinc oxide and lithopone are in a similar position as to output. They are planning to increase production and are not looking for new business. New domestic companies for the manufacture of zinc oxide are reported to be forming and very little zinc oxide of foreign make is coming in. As regards quality the foreign-made goods are fully matched by the domestic.

"BUFLOVAK" VACUUM DRYERS FOR THE RUBBER INDUSTRY

Avoid Oxidation and Overheating by Using "Buflovak" Vacuum Dryers

The high vacuum and low temperature of "Buflovak" Dryers absolutely prevent over-heating and oxidation, which are constant dangers to rubber when exposed to high temperature or oxygen while drying. Other advantages are economy of drying time and reduced labor cost.

"Buflovak" Vacuum Dryers dry all kinds of sheet rubber, rubber compounds, etc.

Profit by the experience of others and get all the facts before deciding on your drying equipment.

"Buflovak" Vacuum Shelf Dryer

We build a complete line of Vacuum Dryers, Evaporators and Chemical Apparatus.

SUBSCRIPTION: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE COMING RUBBER SHORTAGE.**

UNDER THIS DEFINITELY STARTLING CAPTION, Zorn & Leigh-Hunt (London), issue a four-page folder combining statistics and conclusions that will give pause to manufacturers and encouragement to planters. Were not the figures accurate and the conclusions apparently sound, one would take it as promotion talk. To quote the summary of the argument:

"It will be noticed from the above statistics that for the next three years the increase in the world's production of rubber is not likely to exceed 6 or 7 per cent per annum. For the past five years the manufacturing demand has absorbed increases averaging more than 25 per cent per annum. Even if during 1921-1923 the rate of increasing demand should drop to 5 per cent per annum, the world's output will be fully used up. If the rate increases at anything more than 5 per cent we must inevitably reach a period of actual shortage. For instance, supposing that the average increase of the last five years should be cut down to one-half (12½ per cent instead of 25 per cent per annum) we might by the end of 1921 be faced with a shortage of 30,000 tons of rubber,

to be followed by another two years' increasing stringency. The effect of an approaching shortage will make itself felt in the market some time before the position actually arises, as far-sighted consumers of rubber will not quietly wait to be 'caught short.' This no doubt explains why it is possible to-day to sell large quantities of rubber for a couple of years ahead at a substantial premium, over the 'spot' price; forward contracts in fact, have this year been made up to 2s. 10½d. per pound for delivery in 1921. In a word, in the absence of a setback in the trade of the world, there is practically no risk of rubber falling below its present price (except as a temporary fluctuation) while the chances of a rise are almost startling, in view of the statistical position revealed."

NO PROFITEERING IN RUBBER.

PROFITEERS try to palliate their rapacity with the plea that they did not press their advantage nearly as far as they had a chance. In much the same way an impeached British administrator in India once sought to extenuate his crimes of extortion by saying that when he considered the magnitude of his opportunities he was actually amazed at his moderation.

All the opportunities for gouging the public during and since the Great War have presented themselves to rubber manufacturers as well as to others, but to their credit it can truthfully be said that as a class they neither took unfair advantage of the rising price trend nor expressed regret at not having seized upon an abnormal state of trade as a pretext for exacting an unreasonable profit.

Proof of this fact is afforded by the price of rubber tires. In 1910 one popular make of 30 by 3½ fabric tire cost \$26. In 1920 the same tire sells for \$23.20. In 1910 the 33 by 4 size of the same tire sold for \$44 and the 34 by 4 for \$46.50, as compared with the 1920 prices of \$38.60 and \$39.60, respectively. Even more remarkable are the price decreases on the larger size tires. Yet, despite the fact that they have lessened the charge for their products, the tire manufacturers have had to cope with such drawbacks as a 250 per cent increase in the cost of cotton fabric and a 200 per cent rise in wages since 1910, not to mention greatly enhanced prices of compounding ingredients, building materials, machinery, etc.

Luckily, as was pointed out in a recent issue of this journal, raw rubber has remained the one normal commodity, that, despite all the commercial upheavals due to war and the enormous and world-wide demand for it, is still marketed at about the same old, ante-bellum price. But even the continued cheapness of the basic material does not account for the low cost of present-day rubber products. That explanation is to be found in the remarkable enterprise of rubber manufacturers, who, in the past few years, have, with the aid of chemists, engineers and efficiency experts,

devised most ingenious methods of quickening processes, new compounds and labor-saving machinery and by cultivating "human" relations with their employes, have not only speeded up production in a marvellous degree but are also turning out better goods at the lower price level.

PLANTATION FUTURES.

A FRIEND in the Far East advises the Editor of this journal that within five years the rubber plantations in India, Ceylon and the Malay States will be run by Soviets. This change of ownership will come about through a union of the Russians under Lenin and the Hindus and Mohammedans of India, who will throw off the "British Yoke." This would mean \$10 rubber and a greatly lessened production. It would also be "Red Rubber" in the worst sense of the term.

If memory does not play us false the same source predicted the destruction of Malaysian plantations by disease before 1918. The disease came but the planters promptly stamped it out. So, too, will the red disease be stamped out in the Far Eastern possessions.

Nevertheless, not that we believe there is any such danger in sight, America as the biggest user of crude rubber should look far ahead for its supplies. The Philippines for planting are ideal once the Filipino will allow it to be done as the rest of the world does it. Then, too, there are our own rubber producers guayule and *Chrysothamnus*. Of the latter, Luther Burbank, the great plant wizard, in a letter to one of our staff, says that there is not a shadow of a doubt that by analysis of the different individual plants from different localities the rubber content of some will be found to be double that of others, and by starting with these high rubber content plants, and growing from these, any good plant breeder could originate a plant in a reasonably short period that would produce twice as much as the average wild ones do. He says this is a very moderate estimate, as it would not be surprising that a plant should be constructed which would produce ten times the results of the wild ones. Of course vigor is one of the things to be considered, and possibly compactness of growth, and other matters which would come up during the work of improvement.

A seven per cent content has already been found. Double this would be fourteen per cent and ten times as much would be a bonanza. Anyhow, fourteen or seventy, it's worth working for.

LEATHER RUBBER FOOTWEAR.

FOR some time rubber has been closely pressing leather in footwear lines. The rubber heel and the rubber fiber sole have won a notable victory over their leather counterparts. So far, however, the fine leather shoe has not been disturbed in its supremacy. The invention by the brilliant young English chemist, S. J. Peachey, of a new process of vulcanization by

the use of sulphur dioxide and hydrogen sulphide opens new fields of which that now filled by leather footwear is one. By the new process goods of any color, and of almost any texture may be produced without heat or pressure. In other words the fine leather shoe can now be equalled and probably excelled in rubber. Furthermore, this may be done along rubber lines of building and cementing and without the vast array of special machines that are needed to stitch, polish, buff and shape leather shoes. It looks as if a footwear revolution were toward.

OPEN SHOP CITIES.

STUDENTS of industrial conditions attach no little significance to the figures given by the United States Census Bureau showing that the two open-shop cities, Los Angeles, California, and Akron, Ohio, have made a greater growth in the past ten years than any other two cities in their respective classes in the Union. Los Angeles scores a gain of 80.3 per cent and Akron an increase of 201.7 per cent, while Spokane, Washington, lost 2 per cent and Paterson, New Jersey, gained but 8.2 per cent. In both of the latter cities the closed shop still largely obtains, and agitators have done much to foment discord between capital and labor, discouraging not only the extension of old industries but also the starting of new enterprises. The metropolis of the Pacific Coast, on the other hand, has fought long and successfully for industrial freedom and has flourished like the proverbial green bay tree. And in like manner the nation's great rubber center in Ohio, free of the shackles of the closed shop, has prospered as has no other city of similar size in the country. There, under the piece-work system, production is always kept at high pitch, and there, the diligent, faithful worker can rest assured that extra pay will always reward his extra effort, instead of his wage being measured by the meager performance of the laggard and the shirker.

IN AN ARTICLE ON LABOR TURNOVER IN TIRE PRODUCTION, H. O. Smith of the Ajax Rubber Co., Inc., advances an excellent argument to encourage apprenticeship in the tire industry. He says:

"There is a decided advantage in the fact that the tire business attracts the fellow from 18 to 25 years old who is thoughtful and considers his opportunities, and who, realizing when it is too late that he has missed the opportunity of an apprenticeship and learning a trade, finds in the tire industry a remaining chance to develop a possible earning power quite equal to that of the machinist, the carpenter, or the pattern maker. It requires only 60 to 90 days to become an efficient tire maker, while an apprenticeship in other trades usually covers three to four years. For this reason the tire industry can draw from the best untrained material in America."

Experiments With a New Cactus Rubber.

By Emmet S. Long.

IT HAS RECENTLY been the writer's privilege to experiment with a gum extracted from the American cactus and the results have so far been so entirely satisfactory that the subject should undoubtedly be of interest to every one connected with the rubber industry. The war has certainly disclosed the necessity, or at least the desirability, of producing on as large a scale as possible a portion at least of the rubber requirements of this country and for this reason, as well as for the economic betterment of the rubber industry itself, there has resulted considerable activity in the investigation of this important question.

Several years ago the writer had occasion to do considerable experimenting with the extraction and compounding with rubber of a gum derived from the Ocotillo plant, more particularly for the purpose of obtaining a gum which would replace guayule. This plant ranges from five to twenty-five feet in height, growing extensively in certain parts of Arizona and California. The results were satisfactory to a certain extent, but due to the solvent-distillation method of extraction employed, the gum contained a large percentage of resins which seriously affected the cure when used in large percentages in the compound. Later the destructive-distillation process with subsequent refining was evolved with the assistance of government chemists, and it is reported that a much superior product is now being produced in large quantities at the large plant in Arizona.

The cactus gum mentioned at the beginning of this article is found in paying quantities in two different varieties of cactus, one the spineless, or cultivated cactus developed by Burbank and the other the prickly pear or wild species. Spineless cactus has been raised in many parts of Southern California as food for cattle. It was soon learned, however, that many cattle died, probably as a result of the insoluble gum content. The plant consists of a number of lobes somewhat similar in shape to an inverted hot water bottle, each lobe projecting outward and upward from the edge of the one underneath, the number of lobes depending upon the age of the plant. It is easily propagated by breaking off these lobes and planting them in the ground. The plant is very hardy and has the advantage of being easily cultivated upon practically worthless soil or in localities where the rainfall is very slight.

Prickly pear or *Opuntia vulgaris* grows extensively in many parts of Arizona, California, Nevada and other tropical parts of the United States. It is somewhat similar in structure to the spineless cactus, but is covered with long, sharp needles. It bears an edible fruit of a purplish color also covered with spines. Like the spineless, it is very easily propagated and attains a height of seven or nine feet. Unlike Ocotillo and many other gum-bearing plants, the rubber in these two varieties of cactus occurs as a latex and yields a sticky, white liquid from the abraded surface if pressure be applied by the fingers. By special treatment of the latex and subsequent refining, an amber colored gum resembling smoked sheet in color and guayule in physical properties

is obtained, although the gum when thoroughly dried is considerably less plastic than guayule. It is reported that the gum can be produced at a price to compete favorably with guayule and crude rubber.

Following is a summary of some of the experiments made with gum from the spineless cactus:

SAMPLE 1.

	Per Cent.
Smoked sheet rubber.....	50
Cactus rubber.....	40
Compound (mineral ingredients).....	10

This compound was mixed upon the mill in the usual manner and contained only the amount of sulphur usually required to vulcanize a stock having 90 per cent smoked sheet. It mixed easily on the rolls at a much lower temperature than that which would have been required for pure smoked sheet. The next day test strips were cured in the press and were found to have high tensile strength and elasticity, showing that the gum vulcanizes perfectly in about the same length of time required for plantation rubbers. Another portion was used to friction a sample of belting duck which was found upon examination to be thoroughly impregnated with the gum. A very tacky cement was made from the remaining portion by dissolving in benzol.

SAMPLE 2.

	Per Cent.
Smoked sheet.....	20
Auto reclaim.....	20
Cactus rubber.....	20
Compound.....	40

In spite of the fact that this stock was mixed on a relatively cold mill, it retained a sticky surface after calendaring and showed no tendency to bloom in the raw state. It would seem from this that the use of the gum in repair stocks and especially in those containing large amounts of carbon black would be advantageous, due to the necessity of preserving a tacky surface indefinitely, and the lower temperature at which the stock could be milled would minimize the danger of burning when use is made of certain organic accelerators. Part of Sample 2 was used to skim-coat and cover the fabric mentioned above, which was then made into a piece of belting.

SAMPLE 3.

	Per Cent.
Smoked sheet.....	10
Auto reclaim.....	20
Cactus rubber.....	17
Compound.....	53

It was the object of this mixture to estimate the value of the gum in a cheaper compound containing a larger percentage of minerals. No difficulty was encountered in milling and the stock was made into various kinds of articles of comparatively good quality.

SAMPLE 4.

	Per Cent.
Cactus rubber.....	10
Reclaimed.....	60
Compound.....	30

This was a regular heel compound in which 10 per cent smoked

AN ARIZONA CACTUS.

sheet would ordinarily have been used. The smoked sheet was replaced entirely with the cactus rubber without reducing the quality of the heels so far as could be determined. It is interesting to note that the reclaimed rubber used in this case would not stick to the rolls and could not be milled until about two pounds of the cactus rubber was added, when it immediately began to spread out evenly over the roll and continued to adhere thereto until the milling was completed. A number of rubber heels were made from this stock, all of which appeared to be of good quality.

It is the opinion of the writer, as well as of others who assisted in the experiments, that the gum is in every way equal to guayule and in some respects superior, among which may be mentioned the readiness with which it vulcanizes and the extent to which it will actually replace crude rubber without an apparent reduction

in the quality of the finished product. This would evidently place it in a class with crude rubber itself. For use in frictions where penetrating qualities are necessary the gum possesses this property to a marked degree.

The results of these experiments indicate that it may be only a question of time until America may have a new and important industry—the production of rubber from her deserts and waste lands. Los Angeles is already the cynosure of the eyes of the rubber world as the nucleus of a new and rapidly growing rubber manufacturing center. The production of long-staple cotton of highest quality in Southern California has quickly sprung from infancy to a well recognized commercial success and if the cactus rubber possibilities materialize, the United States and even California will be able to produce a complete tire from her own raw materials.

Old and New Methods in Cotton Warehousing and Financing.

By Richard Hoadley Tingley.

THE FINANCING of a cotton crop is one of the most difficult, and at the same time one of the most important problems confronting the southern farmer and business man." This is quoted from an address made in 1915, by R. L. Nixon, specialist in warehousing of the Bureau of Markets, Department of Agriculture. At that time cotton was worth approximately ten cents a pound and the South was suffering from a disruption of trade caused by the war. With prices practically four times those of 1915, the difficulty and importance of the problems become intensified in proportion.

A COTTON CROP WORTH TWO AND A QUARTER BILLION DOLLARS.

It is a recognized fact that but little cotton would be stored or insured were it not necessary to do so in order to negotiate loans with cotton as collateral. Banks have always been willing to advance money on cotton on liberal terms when properly warehoused and insured up to the limit of their capacity but, with a cotton crop worth \$750,000,000, as it was in 1915, and

LACK OF UNIFORMITY IN WAREHOUSE LAWS AND RECEIPTS.

There are many stumbling blocks in the way of a nation-wide participation in cotton financing, many of which will have to be removed before cotton credits can be placed on a liquid footing commensurate with the importance of the business. In the first place, except in the cities of the Cotton Belt and the large commercial centers of the North and East, the banks do not understand cotton paper, it has been outside the line of their activities, and in the second place, the warehousing laws of the country are by no means standardized. Practically every state has its own laws regulating warehouse operations, which differ, often in essential features, from those of other states. It cannot be expected that a national bank officer in, say, Minneapolis is familiar with all of these laws. To keep himself informed, would be an undertaking for which he has not the time. Cotton paper, based on warehouse receipts for goods in store at, say, Atlantic, Georgia, does not interest him.

IDEAL FIRE-PROOF TYPE OF CONCRETE WAREHOUSE CONSTRUCTION.

INTERIOR OF A HOUSTON, TEXAS, COTTON WAREHOUSE, PROTECTED AGAINST FIRE BY AUTOMATIC SPRINKLERS.

a crop valued at \$2,250,000,000 as is this year—and all of it credit cotton at one stage or another, and sometimes oftener than at one stage—the problem assumes gigantic proportions. Such enormous sums, of necessity, take it out of the hands of the comparatively small coterie of southern and northern banks that heretofore found little difficulty in handling the business, and call for nation-wide bank participation—a participation made possible by the provisions of the Federal Reserve Banking Act.

In the third place, there is a woeful lack of uniformity in the receipts given for goods in store issued by warehousemen in different sections of the country. There is no standardized practice in this respect and, in consequence, cotton paper to which is attached a receipt for the cotton stored in a warehouse in, say, Houston, Texas, is not interesting to a banker of Norfolk, Virginia. He not only does not understand the Texas laws that regulate and prescribe the form of receipt but he does not

know the warehouseman at Houston, and cannot take the trouble to investigate his responsibility.

COTTON WAREHOUSES OWNED BY BORROWERS.

It is a well-known fact that practically every cotton warehouse in the South is owned, either directly or indirectly, by the cotton factors and merchants of the locality. Few of these have ever been operated as independent business enterprises, but rather as adjuncts to the chief business of their owners—trading in cotton. Another disturbing factor in cotton financing, as it has been conducted in the past, is this fact of ownership. A cotton merchant in, say, Savannah, Georgia, has bought 100 bales of cotton which he proposes to hold for a future sale. He stores the goods with the X. Y. Z. Warehouse Company in which he is a large owner and possibly an officer or director. The receipt given him for the cotton so stored he takes to his local bank and negotiates a loan with it as collateral. The local bank officer knows perfectly well that he is a large owner in the warehouse and that, in loaning him money with this receipt as collateral he is leaving the cotton practically in the hands of the borrower instead of in the hands of an outside independent corporation—as is the theory of warehousing. Loans so made are therefore based more on the personal standing and integrity of the borrower than on the cotton represented by the receipt which he offers. The bank knows perfectly well that owing to his ownership and control he can take the cotton out of store and sell it and the bank will be none the wiser until afterwards.

Much the same condition obtains in the New England mill centers. There are few public cotton warehouses in the North and cotton is usually stored in the mill yards. Whatever loans are made by local banks with this cotton as collateral are based on the personal standing of the borrower rather than on the merchandise itself, for the New England banker knows well that the cotton for which he holds receipt is out of his jurisdiction and the technical fact that he holds a receipt for it, which he has taken as collateral security, cannot prevent the mill owner from using the cotton and he will be none the wiser until afterwards.

COTTON FINANCING—PRESENT PRACTICES.

I will illustrate further the system that has grown up as a precedent, of financing a cotton crop—a system that has grown obsolete with the advance of time and in the price of cotton, and demands revision, for it now requires more money to finance the cotton crop than any other of the principal crops raised in the United States.

Following the beginning of the crop movement, around September first, demand for funds is made upon local banks by the interior farming districts. These banks, in turn, call upon the large banking institutions in the cities. The first calls are usually for funds to pay for labor employed in picking and harvesting the crop, and for incidental expenses. Small farmers have usually been financed by the local storekeeper from the time of planting to the time of harvesting, but this merely shifts the burden of the bank from the farmer to the storekeeper.

The cotton factors are also dependent upon the local bank for financing their purchases and for their assistance in carrying the farmers. As a result the local bank may find its credit pretty well extended by the time the crop begins to move.

Financing the factors or cotton brokers is the next step. Bankers in the town where the cotton gins are located arrange for payment for the cotton sold by the factors, by furnishing cash tickets issued to the buyers. These tickets the banks hold as collateral. When sufficient cotton has accumulated to permit making a shipment, the local banker delivers the tickets to the agent of the railroad in his town and receives a bill of lading covering the shipment to a compress point.

After arrival of the cotton at the concentration points comes the demand of the mills and exporters. These demands begin in October and continue throughout the winter. From the time

the cotton is picked until it has been converted into a manufactured product fully six months must elapse.

This old method of financing, which is based on single name paper with the staple as collateral, is giving way to the use of trade and bankers' acceptances, and the advantages resulting from such a system have been made possible by the provisions of the Federal Reserve Act.

To illustrate (I quote from John Bolinger of the Shawmut National Bank, Boston): "A Boston cotton broker purchases cotton to the value of \$50,000 from a dealer in Galveston. As the Galveston man wants immediate payment for the staple, the buyer arranges with his bank in Boston for an acceptance credit for ninety days. The Boston bank notifies the Galveston cotton dealer that it will 'accept' his draft drawn at ninety days' sight, for \$50,000, provided bills of lading and other documents are attached to the draft when presented. The Galveston dealer then delivers the cotton to a transportation company and secures a bill of lading for the shipment, which he attaches with invoice and other documents to a draft on the Boston bank. Taking this draft and documents to his own bank at Galveston he discounts it and receives payment for his cotton. The draft and documents are then forwarded to Boston by the Galveston bank for 'acceptance.' After acceptance the draft is returned to the Galveston bank, or may be sold in the open market and the amount placed to credit of its account. The Boston bank retains title to the cotton until its customer provides for the payment of the draft through resale of the cotton."

All of the above is based upon the fact of the warehousing of cotton under conditions now existing.

STANDARDIZED WAREHOUSES RECOMMENDED.

But let us inject a new feature into the transaction, namely, a standardized chain of cotton warehouses covering all important concentration centers of the South and consumption centers of the North, owned by one company and operated as a business proposition. The idea of such an organization has long been the dream of almost every one connected with cotton, no matter from what angle—and it goes without saying that every bank in the land would welcome it.

Such an organization should place itself in so strong a position financially that every bank in the country would recognize it at sight as being sound, dependable, and independent of the "trade." It should provide itself with a form of warehouse receipt that will be recognized as universal the country over so that a banker in, say, Cleveland, Ohio, or Bangor, Maine, will be as familiar with it as he is with the universal form of railroad bill-of-lading that now passes current the country over.

THE UNITED STATES WAREHOUSE ACT OF 1916.

Recognizing the need of innovation in cotton warehousing and in order to provide the machinery necessary for its accomplishment, Congress passed in August, 1916, the United States Warehouse Act. Amended in July, 1919, this act now offers to prospective warehousemen as well as to those already engaged in the business, an opportunity for standardizing their operations under the supervision of Uncle Sam and his Department of Agriculture, and many companies are already availing themselves of the provisions and privileges so offered.

There is nothing compulsory contained in the Act, but it provides for a permissive system of warehouses licensed by and bonded to the United States Government and operated under a system of government inspection and supervision. The Act also provides for the licensing of competent weighers and graders upon application.

The purpose of the Warehouse Act is to create a warehouse receipt of unquestioned value, and one which will be acceptable to all bankers as security for obtaining loans, regardless of the location of the warehouse. In this way, warehousemen will furnish a receipt to their customers which will be of the ut-

most value to them as a negotiable paper, and enable them to borrow close to the actual value of their stored goods at cheaper interest rates. Thus they market their cotton slowly and in conformity with the needs of the manufacturers. The full description of the cotton stored required to be stated on the face of the receipt will enable the owner to know the value of his cotton and enable him to market it intelligently. The proper development of the warehouse will make possible the practice of marketing the cotton crop through the warehouse, and thus avoid the enormous losses resulting from weather damage.

FINANCING UNDER STANDARDIZED WAREHOUSING METHOD.

It will readily be seen that important advantage will accrue to the cotton trade as a whole by the formation of a large operating company, independently owned and controlled, conducting business under the provisions of the United States Warehouse Act with its amendments.

Let us go back to the Galveston dealer and his \$50,000 sale to the Boston cotton broker and see how it would operate under

WEIGHING COTTON BALES AT WAREHOUSE PLATFORM.

the system herein described. The Boston broker could arrange for the storage of his purchase in the bonded warehouse at Galveston; he might move it to port at Savannah or Charleston and store it in a similar bonded warehouse; he might move it to New York, Providence, or New Bedford, and in each of these places he could lodge his cotton under the supervision of Uncle Sam whose receipt would satisfy any banker in the land in Boston, Minneapolis, Omaha, or Portland, Maine. Furthermore, if all of these warehouses were centrally owned and operated in chain, one receipt and one insurance policy would cover his cotton, no matter in which warehouse it was stored or while in transit from one house to another.

PROGRESS OF THE STANDARDIZED WAREHOUSE IDEA.

Emphasized by war experiences and the difficulties and uncertainties of transportation, and by the high price of cotton, cotton men of both the South and North have come together in an endeavor to standardize cotton warehousing and warehouse receipts, by the formation of a big corporation for the purpose. It is likely that some 80 or 100 "going" properties will come into the combination that will cover practically the entire field from Massachusetts Bay to Galveston. The National Association of Cotton Manufacturers endorses it. So does the Federal Reserve Board, for it sees in such a move a warehouse receipt issued by a warehouseman who is not interested in the ownership of the goods involved.

The World Cotton Conference held in New Orleans last October, composed of cotton men from all over the world and from every angle of the business, unanimously endorsed the plan by passing suitable resolutions to that effect.

A DISCOUNT CORPORATION TO HANDLE COTTON PAPER.

It is evident that cotton warehousing and cotton financing go hand in hand; indeed the two phases of the industry cannot well be separated. In order to furnish a broad market for the

vast volume of cotton paper that will be created by putting into practice the innovations I have described, a discount corporation will be formed as an adjunct to the warehousing feature.

Under this dual system, several notable things will be accomplished, making for both improved conditions in the cotton trade and the stabilization of cotton prices. The smaller farmer will be benefited by being able to carry his cotton over a period of depressed prices. The grower or shipper, when storing cotton in a bonded warehouse under government control, would obtain a receipt which would be excellent collateral in case it was desired to hold the cotton for a better market. Such a receipt, being negotiable and guaranteeing the weight, could be converted into cash at any time or in any place. Spot cotton could be dealt in between persons entirely unknown to each other and rejections would cease. The southern producer would have everything to gain and nothing to lose by the proposal. The spinner would likewise benefit by the guaranty, but his chief gain would be the large supplies of cotton assembled at concentration points, thus insuring him against a scarcity of raw material, due to winter transportation difficulties and other obstacles. Last but not least, bankers would be supplied with a large amount of the most liquid and highest grade paper-acceptance on cotton.

SEPTEMBER MEETING OF THE RUBBER DIVISION OF THE AMERICAN CHEMICAL SOCIETY

The next meeting of the American Chemical Society will be held in Chicago, Illinois, September 7-10, when there will be a meeting of the Rubber Division.

At the spring meeting the question of trade names for accelerators and compounding ingredients was discussed. It was pointed out that thiocarbamide was offered on the market under no less than six different names. There are accelerators offered which consist of a certain percentage of some common accelerator, the remainder being a cheap filling ingredient. One of the most notable examples of this type is a mixture of starch and alkali, which is now offered for sale under a trade name at a price which is out of all proportion to its cost. Similar conditions exist to a lesser degree in the market for compounding ingredients.

The Division wishes publicly to announce its stand in the matter, which is the reflection of the opinions of the members present at the last meeting. As a body organized for the advancement of the industry, it does not object to the proper use of a trade name for a product. By proper use, it says that it may be more convenient for the general public to use a trade name rather than a long chemical term. It includes under proper use the fact that the manufacturer shall willingly inform the users of his material what the constituents are which he offers in his product.

It must strenuously object to the marketing of unknown products which are sold under trade names and whose true constituents are supposed to be kept secret. This objection is twofold: it feels that the advancement of the industry is retarded by the use of unknown materials, and also that the public becomes the "goat" by the indiscreet use of unknown accelerators.

In order that the members of the Division may have as full information as possible, it invites statements which have to deal with the subject matter presented, from manufacturers or jobbers of materials which are sold under trade names. The statements made concerning these products may be made publicly or to the Secretary of the Rubber Division.

The Division also invites all of its members and other rubber chemists to submit results of their analyses of these materials to the Secretary of the Division so that these various analyses may be filed for reference of the members.

THE "TUF" INNER TUBE, IT IS CLAIMED, WILL NOT CRACK, CHECK, OR CRAZE, AND WILL OFFER GOOD RESISTANCE TO HEAT AND FRICTION BECAUSE "made just a little better than seems necessary." (Plexus Tire & Rubber Co., Tacony, Pennsylvania.)

Tire Production in the United States.

STATISTICS recently published by the National Automobile Chamber of Commerce, Inc., together with those gathered and prepared by THE INDIA RUBBER WORLD, show the complete resumption of the growth of the rubber tire industry following the check placed upon its normal development by the Government after the United States joined in the world war.

That the phenomenal growth of the American tire output is due chiefly to the enormous and steadily increasing use of the automobile for both business and pleasure in the United States is indicated by the motor vehicle registration for recent years and the fact that only about 2 per cent of the tire product is being exported. The United States consumes practically all the tires it makes.

AMERICAN MOTOR VEHICLE REGISTRATION.

Year...	1913.	1914.	1915.	1916.	1917.	1918.	1919.
Cars...	1,254,971	1,711,339	2,443,664	3,512,996	4,983,340	6,146,617	7,565,446

Assuming five tires per car as the average annual consumption in 1913 and four and one-half tires per car the present consumption, owing to the wider use and longer life of cord tires, the American demand for tires has grown from about 6,275,000 in 1913, to over 34,000,000 in 1919, or nearly five and one-half times that of 1913.

AMERICAN TIRE AND TUBE PRODUCTION.

During the past seven years the American tire and tube production, actual and estimated, has been as follows:

Year	1913.	1914.
Casings under 6 inches.....	*6,588,000	*8,983,000
Tubes under 6 inches.....		

*Estimated

It will be seen that the figures for 1917, the last year prior to government curtailment of tire production, show an increase to nearly four times the output for 1913. Although production in 1918 was curtailed to about 85 per cent of the 1917 output, the 1919 production showed an increase over 1917 of 23 per cent in casings and 48 per cent in tubes. At an average of \$30 per tire the value of the 1919 product of casings under six inches was about \$1,050,000,000, to which may be added \$172,500,000 for the tube production at an average of \$5 per tube, making a total of \$1,222,500,000 for the pneumatic tire output of 1919, exclusive of giant cord tires for heavy trucks.

AMERICAN CRUDE RUBBER CONSUMPTION FOR TIRES.

For the manufacture of the tires and tubes mentioned above the consumption of crude rubber was as follows:

	1917.	1918.*	1919.*
Casings under 6 inches.....pounds	162,643,482	150,000,000	225,000,000
Tubes under 6 inches.....	35,704,446	35,000,000	48,000,000
Solid tires.....	25,055,673	48,000,000	40,000,000
Other tires and sundries.....	9,983,193	15,000,000	12,000,000
Totals	233,386,796	248,000,000	325,000,000

*Estimated.

Only the estimated total weights are available for the years 1913-1916. They are in pounds: 1913, 65,880,000; 1914, 89,830,000; 1915, 128,400,000; 1916, 185,649,570.

In 1919 approximately 60 per cent of the india rubber consumed in the United States was used for tires and tire sundries as against 75 per cent in 1917 and only 58 per cent of the imports for the fiscal year 1913, indicating the greater supply of the raw material. The actual quantity of crude rubber used in 1919, however, was almost five times that for the year 1913, as against about three and one-half times that for the year 1917.

AMERICAN TIRE DEMAND FOR ORIGINAL EQUIPMENT.

Statistics of motor vehicle production in the United States indicate the increasing number of pneumatic and solid tires required annually for original equipment.

MOTOR VEHICLE PRODUCTION.

Year.	Passenger Cars.	Motor Trucks.	Totals.
1913.....	461,500	23,500	485,000
1914.....	543,679	25,375	569,054
1915.....	818,618	74,000	892,618
1916.....	1,493,617	90,000	1,583,617
1917.....	1,746,792	128,157	1,874,949
1918.....	926,388	227,500	1,153,888
1919.....	1,657,652	316,364	1,974,016

Only a cursory inspection of these figures is necessary to see how the production of passenger cars and correspondingly of pneumatic tires under six inches was curtailed by the war situation of 1918, and the production of trucks and truck tires stimulated. Truck tire production for original equipment showed continuous growth during the war period. In 1918 it had increased to over 9½ times the 1913 production for this purpose

and in 1919 to nearly 13½ times the 1913 production. Pneumatic tire production for the original equipment of passenger cars reached its highest figure for the year 1917, when it was more than 3¾ times the 1913 output. This volume of business was not quite reached in 1919, but the output for original equipment that year was more than 3½ times the 1913 production for this purpose. It is seen, therefore, that while 1,940,000 tires sufficed for new equipment in 1913, no less than 7,475,888 were required in 1917, and 7,896,064 in 1919, an increase to over four times the 1913 requirements. Although the greater volume of increase has been in pneumatic tires under 6 inches, the greater rate of increase has been in solid and large pneumatic tires for trucks.

TIRES IN USE IN THE UNITED STATES.

Of the 7,565,446 motor vehicles registered in the United States during the calendar year 1919, some 750,000 were trucks, so that about 8¼ times as many pneumatic tires under 6 inches as truck tires were in use last year, the number of each sort, exclusive of spares and replacements, being approximately 27,235,392 pneumatics under six inches and 3,000,000 truck tires. One additional tire per car would be a conservative estimate for spares and

replacements, making the totals, 34,044,240 pneumatics and 3,750,000 truck tires. With nearly 38,000,000 motor vehicle tires in use it is not surprising that some 25,000 vulcanizers are kept busy with repairs and retreading.

On the basis of 20 pounds of rubber average per car for regular equipment, and one-fourth of that extra for one spare per car, 170,221,200 pounds of rubber were being used last year in American tire casings under six inches alone, an amount almost equal to the total india rubber imports of the United States for the fiscal year ended June 30, 1915, and equal to nearly 32 per cent of the United States india rubber imports for the calendar year 1919.

UNITED STATES TIRE EXPORTS.

Export business has become a considerable part of the American motor tire business as shown by the following statistics compiled by the Bureau of Foreign and Domestic Commerce.

A study of these figures reveals several facts of interest, notably the remarkable growth of tire exports to South America, Asia, and Oceania. The combined value of the 1919 business in these three divisions was over 35 times the value of these exports in 1913. Exports to Oceania fell off in 1917, but the following year had nearly reached the high mark of 1916.

AUTOMOBILE TIRE EXPORTS.

Exported to:	1913 *	1914 *	1915 *	1916 *	1917 *	1918 *	1919 †
Europe	\$1,977,030	\$1,764,240	\$2,745,450	\$10,992,184	\$3,480,114	\$1,460,518	\$11,907,480
North America	1,626,155	1,254,200	1,187,632	1,184,874	3,186,265	4,474,713	5,188,317
South America	100,065	115,387	214,068	1,050,398	2,596,936	3,432,181	4,986,024
Asia	36,212	64,173	73,430	477,895	810,300	1,194,551	2,970,464
Oceania	185,807	279,327	702,877	2,896,401	1,832,244	2,662,422	3,177,431
Africa	17,952	27,940	39,813	334,475	424,342	753,286	694,943
Totals	\$3,943,220	\$3,505,267	\$4,963,270	\$17,936,227	\$12,330,201	\$13,977,671	\$28,924,659

* Fiscal years.
† Calendar years.

North American exports were adversely affected in 1914 and 1915, but thereafter steadily grew until in 1919 they had increased to over \$5,000,000 in value.

The South American trade has maintained a continuous and remarkable growth throughout the seven years under consideration, the value of the 1919 exports being nearly 50 times that of 1913. Exports to Africa grew steadily until 1918, when their value reached some 42 times that of 1913, but showed a falling off of about 7½ per cent for the calendar year 1919 as compared with the fiscal year 1918.

European exports have fluctuated greatly owing to the war. In 1914 they decreased a little, but increased considerably in 1915 and in 1916 jumped to more than five times their value in 1913, after which they declined steadily, the value of the 1918 shipments being only about 74 per cent of the 1913 value. The 1919 exports, however, ex-

ceeded the banner year 1916 by more than 8 per cent, showing an increase to more than 6 times the 1913 value.

Total tire exports to all countries likewise fell off in 1914, but gained in 1915, jumped during 1916 to about 4½ times as much as in 1913, dropped considerably in 1917, but showed a noticeable gain in 1918 and a gain of about 55 per cent in 1919. Automobile tire exports for the calendar year 1919 amounted to more than double the value for the fiscal year 1917. It may be said, therefore, that despite the fluctuations of 1914 to 1917 inclusive, American automobile tire exports have shown a great and steady growth, the value of the foreign business in 1919

having increased to almost seven times what it was in 1913.

TWO NEW VULCANIZATION ACCELERATORS.

A vulcanization accelerator for which many advantages are claimed bears the trade name of "Vul-Ko-Cene." It has been demonstrated in practical work to be remarkably efficient. There is said to be more "kick" in one pound of vulkocene than in three pounds of any other accelerator and it is non-poisonous and prevents blooming.

A vulcanization accelerator of French manufacture is known as "Vulcazol." The makers claim that it is non-poisonous and requires no special precautions in its use. Only one-half to one per cent on the weight of the rubber is required and the time of vulcanization may be reduced from 80 to 85 per cent and a lower temperature be employed. It also prevents blooming by forming a stable combination with the excess of sulphur employed in the mixing.

ACCELERATORS UNDER LICENSE.

The right to use hexamethylene-tetramine, aldehyde ammonia, aldehyde derivatives and other chemical substances as promoters of vulcanization and improvers of vulcanized products, covered by United States patents Nos. 1,126,469 (January 26, 1915) and 1,149,580 (August 10, 1915), granted to Hoffman and Gottlob, is now controlled by the Grasselli Chemical Co., Cleveland, Ohio, to whom the patents have been assigned. The right to sell or use any of the substances coming within the scope of the patents in the manufacture of vulcanized rubber is said to be limited to their licenses.

"THE COMMERCIAL TYPE" FABRIC TIRE TO FIT 30 BY 3½ RIMS IS the most recent announcement of the production department of The Miller Rubber Co., Akron, Ohio. The new tire has been designed to take care of the added weight incident to commercial vehicles. In the past, it has been customary to use either a 30 by 3½ cord or a size larger fabric tire.

PASSENGER-CAR TIRES FOR ORIGINAL EQUIPMENT.

TRUCK TIRES FOR ORIGINAL EQUIPMENT.

Methods for Physical Testing of Vulcanized Rubber Goods.¹

SAMPLING.

(1) SAMPLES shall be taken directly from the finished material. These should be sealed, and marked with maker's name, date of sampling, kind of material and sufficient other data to insure easy and complete identification. The sample should be of such size as to permit of part being taken for test and the remainder stored for future reference.

should the occasion arise. Every precaution must be taken to prevent contamination of the sample by any foreign material, and it must always be stored in a cool place. The object of these precautions is to insure that the sample shall be received in exactly the same condition as it was when taken from the original lot.

(2) In general, the following shall represent the amount of sample required for test:

(a) *Tires*, tubes, etc., of all kinds. One to be selected at random from each lot of 500 or less.

(b) *Hose*. Three lengths from each lot of 5,000 feet or less. A 3-foot section to be cut from each length selected, for bursting tests; other tests to be made on the remainder of the same sample.

(c) *Belting*. One sample 12 inches long from each roll of belting under 6 inches in width and 6 inches long from belting over 6 inches in width.

(d) *Packing*. One sample 10 inches long cut across the full width of the sheet from every lot of 250 pounds or less.

(e) *Molded and lathe cut goods*. One piece selected at random from every 200 pieces or less.

PREPARATION OF TEST PIECES.

(1) For tensile, elongation and set, strips shall be cut 175 mm. long by 25 mm. wide by approximately 2 mm. thick. In every possible case these strips should be cut from the sample. In cases where the sample consists of a large block, as for instance, a section of a solid tire, the strips may be obtained by using heavy meat-cutting machine. When the material is made up with layers of fabric, as in the case of rubber hose, the first step in preparing specimens for the tension test is to separate

the rubber from the fabric. Unless the frictioning is very poor, this will necessitate the use of a solvent. If there is more than one layer of fabric the easiest way is to remove the first layer along with the rubber. The rubber is then separated from the adjoining layer of fabric, using C. P. benzol blown from a wash-bottle. Narrow strips are more easily handled than larger pieces, and there is less danger of injuring the rubber. Great pains

should be taken during this operation because any flaw or local imperfection will seriously vitiate the results. The rubber should be allowed to rest for four hours, in order that it may recover from the stretching it has received and that the benzol may thoroughly evaporate.

(2) Wherever possible test strips should be cut in the transverse direction. In case tests are desired in the longitudinal direction, they should also include the transverse. Directions should be recorded with

FIG. 1. STANDARD DIES FOR CUTTING AND GAGING TEST PIECES. FIG. 1-A. STANDARD DIE FOR CUTTING SAMPLES OF VULCANIZED RECLAIMED RUBBER.

the results of the tests.

(3) In case the articles to be tested will not permit of pieces as above taken, then small sample pieces shall accompany each lot. These may be cured in the form of sheets approximately 2 mm. thick and of such shape as to give the desired length and number of strips, provided further that they shall be guaranteed by the manufacturer to represent truly the average composition and cure of the article delivered. From the piece described above, test pieces shall be cut using for this purpose the standard dies shown in Fig. 1, except with samples of vulcanized reclaimed rubber for which the die Fig. 1-A shall be used. The cutting edge of the die shall be kept sharp and the test pieces may be cut best by striking the die a quick heavy stroke with a mallet, in which case the die should be provided with a handle, or it may be done by attaching the die to the rack of an arbor press, Fig. 2. The piece should be cut against a backing of fine cardboard, hard rubber or leather. The backing or cloth impression shall be removed from the test piece by buffing. Where test pieces are cut from strips of uneven thickness, they shall be buffed to a uniform thickness for about 8 cm. over the middle portion of the strips, after which the test pieces are cut with the die.

(4) For stocks having high elongation such as pure gum, a shorter die giving only 25 mm. constricted portion should be used.

¹Report of Committee of the Rubber Division on Physical Testing. Published by courtesy of the American Chemical Society. Paper read before the Rubber Division of the American Chemical Society, at St. Louis, Missouri, April 14-15, 1920.

(5) **Buffing:** It is recommended that for buffing test pieces, the wheel shown in Fig. 3 be used. The wheel is operated with a $\frac{1}{2}$ -h.-p. motor. The rubber to be buffed is clamped to a carriage which is moved back and forth under the 5 by 1-inch emery wheel (No. 60) running at about 3,000 revolutions per minute. The central portion of the carriage just under the rubber is slightly raised, by which means it has been found that the operation is more easily performed and with less danger of injury to the rubber. The wheel has a vertical adjustment and a thumb-screw serves to lower the wheel by very small amounts as the buffing proceeds. Shields are provided for the purpose of keeping the fine particles of rubber off the guide. The starting base, though not necessary, is desirable in bringing the wheel gradually up to the maximum speed.

(6) **Measuring Width and Thickness:** A micrometer of the

rack and pinion and dial micrometer type, Fig. 4, shall be used, using a known weight (225 grams), namely, just enough to actuate positively the rack and pinion and bring the disk positively on the face of the test piece without compressing the rubber. The shoe and base which presses against the rubber shall be 1 cm. in diameter.

(7) In case of asbestos packing, which is very stiff, it is necessary to use a greater weight to obtain the correct thickness: 3 kg. on the foot 1 cm. diameter should be used.

(8) Before any tests are made, the width and thickness shall be determined by taking several readings on the constricted portion of the specimen. The cross-sectional area shall then be determined on the basis of the readings which show the smallest cross section.

(9) **Conditions for Making Tests:** All tests of the rubber parts shall be made in a room the temperature of which is between 15 and 35 degrees C. The tests shall not be made until the test pieces have stood long enough to attain room temperature (not less than 4 hours). In case it should be impossible to perform the tests in room temperature within the limit of 15 degrees and 35 degrees C., a box or conditioning chamber is provided which can be kept uniformly at 24 degrees C., in which the pieces should be placed before testing, for a period of 4 hours, and the test performed immediately after removal from the chamber.

(10) **Aging after Curing Before Testing:** The slabs from which the strips are cut shall have been cured at least 24 hours before the test is made.

(11) **Data on Reclaimed Rubber:** The report of tests on

vulcanized reclaimed rubber shall be accompanied by a statement in regard to the cure of the slabs from which the test pieces were cut; this statement shall include time and temperature of the curing heat and the amount of sulphur used.

PHYSICAL TESTS.

(1) **Tensile:** Tensile may be defined as the force required to break a piece of unit cross-section area. It should be expressed in kilograms per square centimeter.

(2) **Elongation:** This term is used to express the increase in the length of the test piece measured between two marks placed on that portion of the test piece which is of uniform cross section. It should be expressed in per cent.

(3) **Set:** This term is used to express the increase in the length of the test piece measured between two marks placed on that portion of the test piece which is of uniform cross section,

after it has been stretched to 60 per cent of its breaking elongation for three successive times, holding it under this elongation for ten minutes each time, and permitting five-minute intervals of rest between each interval of stretch, and finally allowing it to rest ten minutes before the final measurement is taken. It is measured in per cent, based on the original length.

(4) **Gage Marks:** The gage marker, Fig. 5, shall be in the form of a stamp having thin steel blades which are strictly parallel and 50 mm. apart; another marker

having blades 25 mm. apart shall be used for the high-grade stocks such as pure gum. The blades shall be kept clean and free from accumulation of ink, in order that the lines marked on the test pieces shall be very fine.

(5) **Number of Tests:** At least four strips shall be tested in every case and the average of these tests taken.

(6) **Report of Results:** Since the physical properties of rubber vary noticeably in any given product, it may occasionally happen that tests are made upon a test piece which will be of poor quality. The material as a whole meets the requirements of the standard, but the particular piece taken falls somewhat below it. To reject or accept a lot of, say, hose, belting, packing, etc., because of failure of just one test piece to meet the specifications, would, therefore be unfair. For this reason, acceptance or rejection of an item offered for delivery shall be based on the average of at least four determinations for each quantity. In arriving at these averages no weight shall be given to tests which are obviously in error, and do not represent true average conditions; namely, cases in which the tensile strength is low on account of a small flaw in the article. If the tensile strength of

FIG. 2. ARBOR PRESS FOR CUTTING TEST PIECES. FIG. 3. BUFFING WHEEL AND ELECTRIC DRIVE. FIG. 4. DIAL AND HAND MICROMETER. FIG. 5. GAGE MARKER (SEE FIG. 1 FOR DETAILS OF CONSTRUCTION). FIG. 6. SPECIAL JAWS FOR PURE GUM TESTS.

a piece falls more than 10 per cent below the specified amount, it shall not be counted in calculating the average strength, providing that in no case shall more than 25 per cent of the pieces tested be eliminated on this account. In other words, the object of test is to determine the quality of the article as a whole.

(7) Adjusting Test Piece in Grips: The test piece shall be adjusted in the grips, care being taken to insure a uniform distribution of stress over its cross-section.

TESTING MACHINES.

(1) The testing machine shall be power driven and shall meet the following requirements:

(a) It shall indicate and record correctly the applied load, and its accuracy shall be tested from time to time by calibration with dead weights. The tension indicator shall not jump back more than 0.5 per cent when the specimen breaks. A machine

B = Tension in kilograms indicated by machine at breaking point.

W = Width of test piece measured to 0.01-mm.

T = Thickness of test piece measured to 0.01-mm.

In other words, the tensile in Kg/cm² is obtained by dividing the breaking load expressed in kilograms by the cross section area of the test piece expressed in square centimeters.

(2) Elongation: The ultimate elongation should be measured with a steel tape graduated to millimeters, attached to trammel points fixed on a rod running parallel with the test piece and so arranged that they slide on this rod (Fig. 7). The trammel points are then always kept even with the marks on the test piece and after the piece has broken, the scale will record the distance between the marks at the time of breaking. If the initial distance between the marks is 50 mm. and the

FIG. 7. DEVICE FOR MEASURING ULTIMATE ELONGATION.

FIG. 8. APPARATUS FOR DETERMINING THE SET.

FIG. 9. PIPE CONNECTIONS FOR STEAM HOSE TEST.

for which the load is applied by tension on a spring should not be used.

(b) The grips shall separate at a uniform rate of 50 cm. per minute, except in the case of friction pulls where the rate of separation should be 25 mm. per minute, or for testing hard rubber the rate of separation should be 4 mm. per minute.

(c) The grips shall tighten automatically and exert a pressure proportionate to the applied tension. The grips shall exert a uniform pressure across the width of the test piece regardless of any variation in the thickness of the rubber. If the nature of the rubber is such that the jaws cut it in course of test, namely, pure gum inner tube stocks, a jaw such as shown in Fig. 6 is much more satisfactory.

(d) A device shall be provided for instantly starting and stopping the motion of the movable jaws; also means to enable the operator to return the movable jaws rapidly to their initial position.

(e) Computing results. Tensile, in kilograms per square centimeter equals

$$\frac{B}{W \times T} \times 100$$

distance between the marks at the breaking point is 150 mm. the per cent elongation will be 150 mm. minus 50 mm., divided by 50 mm., multiplied by 100 equals 200 per cent. Or it may be expressed by

$$\frac{L_f - L_o}{L_o} \times 100 = \text{Per cent elongation.}$$

Where L_o equals initial distance between the marks, L_f equals distance between the marks at the breaking point.

(3) Set: For determining the set, the apparatus shown in Fig. 8 shall be used. The test specimens shall be prepared the same as the pieces used for tensile and ultimate elongation tests. Its operation is as follows: The specimens being in the grips, one of the spools is moved along the shaft until it engages the corresponding pin, and the shaft is revolved until the specimen has been stretched to 60 per cent of the breaking elongation measured between gage marks. The clamp is tightened to hold the specimen in this position for 10 minutes. The specimen is then released and allowed to rest under no elongation for five minutes. It is then stretched to 60 per cent as before and held 10 minutes again, then released and allowed to rest another five minutes. Again stretched to 60 per cent as at first, and held a third 10-minute period, after which it is released and after being allowed to rest five minutes, the final measurement of the distance between the two marks is made. The initial distance be-

tween the two marks subtracted from the final distance gives the increase in length or the set and this distance divided by the original length multiplied by 100, expresses the set in percent of the original distance. For example, if the original length is 50 mm., and the final length is 57.5 mm., the set in per cent will be 57.5 minus 50 mm., divided by 50, and multiplied by 100, equals 15 per cent.

(4) Taking of Time: All measurements of time shall be by means of a stop-watch or with a watch having a second hand. The fundamental methods of testing are so made throughout the entire rubber specifications that the following procedure shall be uniform. After placing any test piece in the machine ready for stretching, the piece shall be drawn just taut and the stop-watch started at the instant of the beginning of the stretch.

Then in case a piece is held for 10 minutes at a certain distance, the time shall be again measured at the moment the piece is released. This moment is simultaneously the beginning of the period of rest. The measurement is then to be taken at the instant of the expiration of the second 10 minutes.

(5) When the specification calls for a 1-minute stretch and a 1-minute rest, the time consumed in stretching to the specified elongation shall not exceed 15 seconds.

(6) Initial Tension and Reduction in Tension after a Specified Elongation for a Given Length of Time: For this purpose

FIG. 10. APPARATUS FOR TESTING FRICTIONS.

the apparatus illustrated in Fig. 8 may be used. Its operation is similar to that of the apparatus shown in Fig. 7. If desired a spring balance may be used in connection with the apparatus shown in Fig. 7.

(7) Friction Adhesion: Definition of Friction: By friction test, is meant the strength of the adhesion of the fabric plies that will meet the test given in the various specifications for adhesion between the fabric plies or between fabric and cover.

(8) Method of Making the Test: A section a little over 25 mm. in width should be cut and raveled down to exactly 25 mm. After starting the separation as previously described under "Preparation of Test Pieces," the ends of the pieces are gripped in the jaw of the testing machine after which separation is affected by running the machine so that the jaws separate at a uniform rate of 25 mm. per minute. The weakest point shall be recorded and the average taken.

(9) In the case of tire frictions and hose frictions it is usually desirable to make a separation between every ply; with belts the usual practice is to make a separation of two plies at a time.

(10) Apparatus and General Method of Conducting Dead Weight Tests.

Friction: A testing frame, Fig. 10, suitable for the purpose shall be used. This may consist of a wooden frame provided with roller bearings at the top in which a mandrel is free to revolve. The total weight including the clamp suspended from

the test piece, shall be equal to that called for in the specifications.

(11) A movable platform should be provided for supporting the weight while adjustments for the tests are being made. The arrangement should be such that the platform may be gradually lowered until the weight is carried by the test piece, after which it should be dropped or swung to the side. In every case this operation should be accomplished without a jerk. With the weight hanging freely from the test piece a mark shall be made along the line of separation of the layers, and at the same instant the time shall be noted for the beginning of the test. At the end of 10 minutes, or as great a part thereof as possible, a second mark shall be made along the line of separation. The distance between the marks, measured after the weight has been removed, shall be used in computing the rate of separation.

(12) Plid Hose: In preparing test pieces, a short length of hose is pressed tightly over a slightly tapered mandrel. The mandrel is put in a lathe and 25-mm. rings are cut with a pointed knife. Beginning at the lap a short length of the fabric is separated and the ring is pressed snugly over a mandrel which is placed in the roller bearings on the test table. To the detached end of the fabric is fastened a clamp provided with a hook or ring from which the weight is to be supported.

(13) Cotton Rubber-Lined Hose: In preparing a sample of cotton rubber-lined hose, a 5-cm. section shall be taken and cut at the lap to give a strip equal in length to the circumference of the hose. From this section a 40-mm. strip shall be cut with as little injury as possible to the cotton jacket. The jacket shall be separated from the lining for about 40 mm. at one end. The detached end of the jacket is held in a stationary clamp which is supported by the testing frame and the specified weight is suspended from the rubber lining.

(14) Rubber Belting: When testing rubber belting, a 25-mm. strip cut either longitudinally or transversely, shall be used. The strip shall consist of two plies of fabric only, these plies to be the second and third plies of the belt, numbering from the top cover or from the bottom cover, as may be desired.

(15) Packing and Gasket Material: When testing packing or gasket material, the pieces shall be prepared and tested as in the case of cotton rubber-lined hose, unless the thickness of rubber is greater than 27 mm. under which conditions the piece shall be prepared in such a way that the rubber part is to be clamped at the top and held immovable while the weight is to be clamped to the fabric. The test strips shall be cut in both directions.

(16) Tuck's Packing: The friction in round Tuck's packing shall be tested by the same method as is used in plid hose, the core being drilled out to permit the insertion of a mandrel. Whenever the core is 5 mm. or less in diameter it shall be tested in its original shape. When it is over 5 mm. in diameter a piece 15 cm. long shall be separated from the fabric and cut and buffed on four opposite sides to form a square section 2 mm. by 2 mm. in the center of the test piece. The 2-mm. square shall be at least 25 mm. in length.

(17) Hydraulic Pressure Test of Rubber Hose: The hose shall be stretched out for inspection, connected to the pump, and filled with water, leaving the air cock open to allow the air to escape. The air cock shall then be closed with a pressure of 1 kilogram per square centimeter applied. The test is then begun by taking original measurements without releasing the pressure.

(18) All pressure measurements shall be made with a standardized gage. The increase in pressure shall be at the rate of 715 kilograms per square centimeter per minute and the hose under test shall be held for measurement not more than two minutes, unless otherwise called for in the specifications. The hose under test should be protected by a frame of metal or wood, or of heavy plate glass so that in case a piece breaks during the test the operator will not be injured.

(19) Steam Test for Rubber Hose: The arrangement of pipe connections shown in Fig. 9 is recommended. The header (1)

is provided with 6 outlets connected with a steam trap (3) that is provided with inlets and controlling valves. The hose to be tested is cut into lengths that will just fit between the connections on the headers, the bottom connections being made with unions. Steam at specified pressure passes into the header (1)

and thence through the hose to the header (2) from which the condensation is carried to the steam trap. The hose under test should be protected by a frame of metal or wood or of heavy plate glass so that in case a piece breaks during the test, the operator will not be injured.

Notes on Accelerators.

By Henry P. Stevens, M.A., Ph.D., F.I.C.

ALTHOUGH the mineral accelerators such as magnesia and litharge have been used for many years, the term accelerator was seldom heard until the introduction of the organic accelerators or vulcanizing catalysts. As the latter term implied, these substances are believed to owe their efficiency to their catalytic effect as intermediary in the reaction between the caoutchouc molecule and the sulphur. This view is rather supported by the recent discovery of Peachey that vulcanization is effected by allowing sulphur dioxide and hydrogen sulphide gases to react in the presence of the rubber. The reaction takes place spontaneously at room temperature, showing the greatly increased reactivity of sulphur in the nascent (atonic?) state. Catalysts are supposed by some to owe their efficiency to the formation of intermediate products. In the case of accelerators, the intermediate product would be formed with the sulphur, which would then decompose, liberating the sulphur again and reforming the accelerator. The liberated sulphur would not be in the ordinary molecular state at the moment of liberation and might therefore be more reactive as in the case of the nascent sulphur liberated by the reaction between sulphur dioxide and hydrogen sulphide. It does not follow, however, that when an element is liberated in the course of a chemical reaction it is necessarily in a more reactive form. Sulphur liberated by reactions other than that described does not appear to vulcanize rubber. In such cases, either the element is not particularly reactive at the moment of liberation or the conditions are such that ordinary molecular sulphur is formed before the active form has had an opportunity to react with the caoutchouc or rubber present. It may be necessary that the catalyst should be in intimate contact (to use crude expression) with the caoutchouc molecules or aggregates. In Peachey's reaction we have a gas (sulphur dioxide) which is soluble in rubber to an appreciable extent. We may assume that the gas is in intimate contact with the caoutchouc aggregates, possibly adsorbed on the particles of which the colloid is composed. Under these circumstances vulcanization takes place when the sulphur is liberated and is so far complete that an ordinary degree of vulcanization can be obtained with hardly any free sulphur produced, that is to say, practically the whole of the sulphur reacts with the rubber at the moment it is liberated.

The organic accelerators are substances which easily mix with rubber, in fact they are probably soluble to a certain extent in raw rubber and consequently fulfil the above suggested condition of intimate contact in the event of their combining with sulphur and consequently liberating this sulphur in a more reactive form. If this theory is correct the liberation of the sulphur and consequent vulcanization of the rubber may be regarded as taking place instantaneously. On the other hand the formation of the intermediate substance by combination between accelerator and molecular sulphur may take an appreciable time period. If this be so the efficiency of an accelerator will primarily depend on the rate of reaction between it and molecular sulphur, provided that the substance formed can be dissolved or adsorbed to a sufficient extent by the caoutchouc with which it reacts. The reaction between the accelerator and the sulphur has been discussed by Bedford and Scott (*THE INDIA RUBBER WORLD*, January, 1920, page 207), who show that the efficiency of some ac-

celerators is probably dependent upon the intermediate formation of thiourea derivatives as they react with sulphur at vulcanization temperatures. Similarly it has been suggested that the efficiency of isonitroso dimethyl aniline depends on its reduction and the formation of an amino derivative which actually functions as the accelerator. This, however, is not supported by the relative accelerating power of para nitroso phenol and para amido phenol. The former is an accelerator, the latter has no appreciable accelerating effect. In some cases it may be that the intermediate product is not so readily formed and requires a temperature higher than the ordinary vulcanizing temperature if it is to be produced in appreciable quantity. At any rate it is claimed that distinct advantages result from the use of the reaction product of the accelerator and sulphur over a mixture of the two. As examples, methylene-aniline and methylene-diphenyl diamine have been quoted. (British patent No. 130,857, *THE INDIA RUBBER WORLD*, November 1, 1919, page 80.) The main curing effect produced has been ascribed to the formation of their carbanilides. It is obvious that the action of accelerators may in many instances be very complicated and there is a large field open for investigation. My own work carried out years ago (1911 and 1912) showed that without a nitrogenous constituent rubber could hardly be got to vulcanize at all. Nature fortunately provided the rubber manufacturer not only with the raw material but also with the catalyzer necessary to effect vulcanization.

The action of inorganic accelerators differs in some respects from the organic accelerators. It is commonly stated that the latter are more efficient and this impression arises from the relatively small quantity of inorganic accelerators employed in rubber compounding, quantities such as $\frac{1}{2}$ to 1 per cent on the weight of the rubber being commonly employed. It is obvious, however, that larger quantities would detract from the physical properties of the rubber, for, apart from their accelerating value, they are merely compounding ingredients without strength or elasticity. Moreover, the price would restrict the quantity employed. On the other hand, some of the mineral accelerators are generally regarded as exerting a beneficial effect apart from their accelerating action. The magnesias, carbonate and calcined, are examples. Large quantities of the light carbonate are used for the apparent toughening effect produced, apart from the small accelerating action which this mineral possesses. The calcined magnesia has very considerable accelerating power and is comparable with many efficient organic accelerators, particularly when used in quite small amounts—up to say $\frac{1}{2}$ per cent. Kratz and Flower are of opinion that its accelerating power is only indirect. That is to say, it does not accelerate vulcanization by direct action on the rubber but merely liberates and renders more active the nitrogenous accelerator present in the rubber. Some of the organic accelerators are extraordinarily efficient—for example, dimethylammonium-dimethyl-dithiocarbamate (the addition product of dimethylamine and carbon bisulphide), which, according to Crauer, is rendered still more active in a rubber mix containing a small quantity of zinc oxide. One-half per cent of this accelerator enables satisfactory vulcanization to be effected in three or four minutes instead of 50 minutes. It was also found that spontaneous vulcanization of this stock takes place in the cold and the compound is very fairly vulcanized after one to two months'

storage at room temperature. The effect of zinc oxide in activating organic accelerators is not in the least understood. Twiss, in a recent paper, gave figures for some other organic accelerators which are similarly activated by a small quantity of zinc oxide; in fact without zinc oxide many of them would be of little use.

We have considered the accelerating effect—that is to say, the catalytic action—of these substances in promoting the union of caoutchouc and sulphur, but it is also of interest to compare the physical properties of rubber vulcanized with and without an accelerator. For this purpose we make use of the coefficient or percentage of combined sulphur calculated on the raw rubber as the basis on which to compare the physical properties; in other words, we determine the breaking strain and elongation of the specimens vulcanized to give the same coefficient. Gottlob noticed some time ago that there was considerable danger of overcuring—that is to say, formation of an unstable vulcanizate—if rubber containing an organic accelerator was fully vulcanized. In a series of cures it was found that without the accelerator the breaking strain of the overcured specimens showed a gradual reduction with the excess curing, while in the presence of an accelerator the decrease in tensile strength was very sudden. He did not, however, publish any aging tests in confirmation. The writer and others have shown that a pure rubber mix is best cured to give a coefficient of approximately 3, if tensile figures are considered in conjunction with aging tests. When, however, accelerators are added, it appears from Cranor's figures that the coefficient should be much lower if satisfactory aging results are to be obtained. When using powerful catalysts with a small proportion of zinc oxide it is probable that the rubber is sufficiently vulcanized when the coefficient amounts to one unit. The higher tensile figures obtainable by the use of organic catalysts appear, therefore, to some extent illusory. Some recent figures of Seidl are worth quoting in this connection. He made up four "mixings" and vulcanized for varying periods at 138 degrees C. The results in the accompanying table show the physical properties and time of cure for six fixed percentages of combined sulphur ("*Gummi-Zeitung*," June 18, 1920, pages 797-8). The physical tests were made on rings of 4 square millimeters cross-sectional area, and I have recalculated the breaking strain to grams per square millimeter cross-sectional area.

the same breaking strain as that without accelerator having a coefficient of 2.47. Consequently to obtain a breaking strain of 590 grams per square millimeter a rubber and sulphur mixing must be vulcanized to double the coefficient which would be necessary if a suitable accelerator were added. To yield a breaking strain of 1,160 to 1,170 the use of a mix without accelerator will necessitate vulcanizing to give a 50 per cent higher coefficient. For a breaking strain of 1,540 to 1,550 the coefficient must be raised 30 per cent. With breaking strains over 2,000 the coefficient does not require to be raised and is practically the same for both mixes. We therefore have a progressive relationship. The difference in the coefficient required to produce the same breaking strain being less and less the higher the coefficient. With 1 per cent of the accelerator used by Seidl, the rubber would appear to be fully cured round about a coefficient of 2 to 2.5 against the figure of 1 suggested by Cranor for the very efficient accelerator which has been used in his experiments.

A comparison of columns 3 and 4 is also of great interest. The compounds used differ only in the percentage of sulphur. It has been stated that approximate proportional vulcanization exists between the coefficients and added quantities of sulphur in ordinary rubber sulphur mixings. The figures show that a similar condition holds for accelerator compounded mixings. The time required to produce the same sulphur coefficient is approximately two-thirds, in the case of the 15 per cent sulphur mix, of what it is in the 10 per cent sulphur mix. It is said that rubber can dissolve only a limited amount of sulphur—about 10 per cent and, therefore, larger quantities merely act as a diluent and tend to hinder rather than promote the reaction. As caoutchouc sulphide is formed, larger quantities of sulphur can be dissolved, as caoutchouc sulphide is a better solvent for sulphur than raw rubber. (Compare work of Skellon, also "Communications of the Netherland Government Institute for Advising the Rubber Trade and the Rubber Industry," 1916, page 239 et seq.) Consequently, as vulcanization proceeds, a larger proportion of sulphur is dissolved (if available) and an increase in rate of cure results. One would not expect such an increase until an appreciable proportion of sulphur had combined with the rubber. If we compare the third and fourth columns it will

Combined Sulphur Per Cent.	(1)			(2)			(3)			(4)		
	100 parts rubber, 10 parts sulphur.			100 parts rubber, 5 parts sulphur, 1 part accelerator.			100 parts rubber, 10 parts sulphur, 1 part accelerator.			100 parts rubber, 15 parts sulphur, 1 part accelerator.		
	Breaking Strain. Grams.	Stretch. Per Cent.	Time of Cure. Min.	Breaking Strain. Grams.	Stretch. Per Cent.	Time of Cure. Min.	Breaking Strain. Grams.	Stretch. Per Cent.	Time of Cure. Min.	Breaking Strain. Grams.	Stretch. Per Cent.	Time of Cure. Min.
0.82	90	87.5	50	450	1,030	8	590	619	15	1,280	875	5
1.63	590	62.7	140	990	969	24	1,170	619	15	1,900	841	12½
2.47	1,160	936	110	1,390	945	40	1,590	892	27	2,050	805	17½
3.21	1,540	895	88	1,570	932	58	1,780	852	40	2,250	773	22½
3.90	1,880	837	315	2,080	823	42	2,870	740	30
4.51	2,440	805	382	2,320	318	56	3,250	745	40

PHYSICAL PROPERTIES AND TIME OF CURE FOR SIX FIXED PERCENTAGES OF COMBINED SULPHUR.

To study this table we may concentrate on the first and third series of figures. The compounds differ only in that (3) contains 1 per cent of accelerator. This reduces the time of cure to about one-seventh or less. It will be noted that the sulphur is present in considerable excess even when the maximum amount (4.57 per cent) is combined. If the breaking strains are compared it will be seen that the addition of the accelerator produces a very considerable increase of breaking strain at the lower cures, that is, up to about 3 per cent of combined sulphur. For 3.9 and 4.5 per cent of combined sulphur the breaking strains are practically the same for both mixings. At this stage both are overcured. The difference in breaking strain is therefore confined to normal cures. The breaking strain of the accelerator compounded rubber with a coefficient .82 is approximately equal to that without accelerator having a coefficient of 1.63. Similarly the accelerator compounded rubber with a coefficient of 1.63 gives approximately

be seen that a considerable increase in rate of cure results from increasing the proportion of sulphur from 10 to 15 per cent. The time of cure is reduced from 7½ to 5 minutes and proportionately. At the same time the breaking strain is more than doubled. In fact with 15 per cent of sulphur the rubber appears fully cured with a coefficient but little exceeding one unit. If this is so, the coefficient corresponding to the correct cure will depend not only on the nature and proportion of accelerator but also on the proportion of sulphur added. It is not possible to speak positively until aging experiments have been carried out. In this connection I would much prefer tests made at about normal temperature, say not above 30 degrees C., rather than so-called accelerating aging tests at higher temperatures. Temperature is not the only factor in aging and it is doubtful whether it is safe to assume that the accelerated aging tests will give results comparable with those carried out at room temperatures.

The Manufacture of Battery Jars.

In 1919 there were in round numbers 7,000,000 passenger cars in use in the United States. If one-half of this number were equipped with lighting and starting batteries that cost \$40 each, the outlay would be \$140,000,000 for batteries. The estimated number of starting and lighting batteries now in use is 5,253,073, valued at \$236,388,285. Allowing three jars to a battery, 15,759,219 hard rubber jars, valued at \$20,000,000, would be required.

It is estimated that there are 100,000 electric vehicles in the United States, of which 50,000 are passenger and 50,000 are commercial. The cost of the average battery is about \$600 for a passenger car and \$1,000 for a commercial car; a total expenditure of \$30,000,000 for passenger and \$50,000,000 for commercial cars. The average number of cells is 32 in a passenger car and 44 in a commercial, or a total of 3,800,000 jars. The average cost of a jar is about \$2, therefore the total expenditure for hard rubber jars for electric vehicles will be \$7,800,000.

There are other uses for storage batteries, such as supplying light and for power and ignition purposes in a great variety of applications. No substitute has been found as yet that will replace hard rubber for battery jars.

Battery jars are made mostly on white metal forms constituted of lead, tin and antimony. These forms are easily made and with very little machining. White metal is used in preference to cast iron although cast iron is more durable. The reason for this is that there are so many changes of sizes made by customers and a variation of shrinkage allowances due to the different kinds of raw material used, that it is easier to melt and cast a core over than it is to machine it.

The core is shaped as shown in Fig. 1. The walls A are about $\frac{3}{16}$ -inch thick and the grooves B vary in number from two to as many as the customer specifies. At the bottom of the groove B two or more small holes are drilled into the air chamber D so that the ribs of the jar can be cured more easily, and then two larger holes are drilled in the sides as shown at C. This is done so that when the air expands in chamber D, while curing, it will have a chance to escape and when the jar is being pulled from the core, it allows an inlet of air so that no vacuum is created between the jar and the core, thus making it easier to remove the jar. These holes can also be used with a mechanical device to remove the battery jars from the forms after curing.

four of which are used and then D is inserted to act as a core for the air chamber. This core is slightly tapered on the sides to draw easily when removing it from the mold. The core and angle-irons should be heated up to very near the temperature of molten metal. This can be done by immersing them in a pot of molten metal. As white metal has a greater specific gravity than iron, the iron parts will float. These parts will, therefore, take up enough temperature so as not to allow the molten metal to chill too quickly when pouring and will then give the surface of the form a very smooth finish. The metal is then poured in this form and a long wire rod is pushed in and out in the molten metal to remove any trapped air that would cause air holes in the cores.

The angle-irons A should be made very accurately and of sufficient strength so that they will not warp because of constant heating and changing of temperature.

A great deal of tin-foil about .005-inch thick is used throughout the manufacture of articles made from hard rubber, and the making of battery jars is no exception to this rule. It helps to handle the sheet rubber and is an asset in the vulcanization. It also gives the outside surface a polished effect. At one time the specifications for battery jars stipulated this surface condition but now it is not required.

Before putting the jars in series into containers, the acid sometimes splashed and frequently ran over the sides, and if the jar was perfectly smooth the acid would run off, but if the sides were rough as they are when the jar is not made with tin-foil, the drops of acid would adhere to the sides and make a rather unsightly appearance.

After the stock is compounded it goes through a process illustrated in Fig. 3. The stock is first warmed in a mill shown at A and the operator then feeds the stock to the calender B. To keep the thickness of rubber more uniform and to eliminate all air pockets, the stock is plied, two or more plies, depending on the thickness required, on a large drum shown at C. This drum runs at the same speed as the calender B and is approximately 3 feet 6 inches in diameter and is water-cooled. The calender man applies a sheet of tin-foil to the drum C and the rubber sheet is plied on this tin-foil. Another man handles a hand operated conveyor shown at D and cuts the stock from the large drum in two pieces and lays it on a tray. The width of stock run from the calender is the correct length for wrap-

FIG. 3

The molds used are of a collapsible type as shown in Fig. 2. Various sizes of angle-irons A are made to agree with the various sizes of jars being made. The base B acts as a gage to set up the angle-irons A and forms the rib places in the core. The angle-irons A are then clamped with special clamps C,

ping around the core for making jars. It requires three men to operate these machines.

The next step is to cut these sheets to correct widths for the jars, allowing a surplus for trimming top and bottom. This is done by laying the stock on a flat, smooth table, marking with a

piece of chalk and then cutting to size with a knife. When tin-foil is used these sheets can be stacked but when it is not used, trays or books with several sheets of holland must be used.

A gang of six men work at a table shown in Fig. 4, with wooden tops A and a steam-table B which carries approximately eighty pounds' pressure. These men make up the jars and remove them from the cores after they are cured. For this work they get from five dollars to eleven dollars per 100 jars, depending on the make and size. One of these men is called the leader and is directly responsible for the men and for defective jars made by his gang. The steam-table is used to warm up the cores and stock. When the core is warm, it gets a coat of silicate of soda which dries very quickly. This solution prevents the finished jar from sticking to the core and facilitates its removal from the core.

The ribs are then assembled in the core cavities as indicated in Fig. 5. They are inserted (See A) and pressed down with the knife handle used for trimming; the trimmed rib is shown at B. These ribs are made from a dry stock, mostly hard rubber dust and shoddy, and soap-stoned so that they will not stick to the core. After the ribs are trimmed, the bottom and ribs are coated with cement and placed on a piece of rubber which forms the bottom of the jar. The core is then

turned over as shown in Fig. 6 and the rubber is trimmed with the knife B using the core as a guide. The sides are then cemented so that the rubber will stick to the core.

The sides are next wrapped as shown in Fig. 7 and the rubber sheet A trimmed at B. By pressing the knife handle along the edge B the impression shows where the stock meets. Using this impression as a guide, the surplus stock is trimmed off and the sides are then rolled down to press out any trapped air between the core and walls. This is done with a steel rolling pin, weighing about fifteen to twenty pounds.

The top is next trimmed as shown in Fig. 8, using knife B and a wooden block A, which is the correct height. A hard rubber block as shown at C is then inserted, the thickness of which allows enough rubber to be turned over on the bottom after trimming with the knife D. The edges are then turned in as shown in Fig. 9, working from both ends, first at A and then B, when the reinforcing strips are assembled as shown in Fig. 10 at A.

The identification of the customer and the gang number are then stamped on the jars which are stacked on small heater trucks, care being taken that they do not touch each other, and they are vulcanized from four to four and one-half hours at approximately fifty-five pounds pressure.

Some manufacturers have designed and built machines for wrapping battery jars mechanically, but these machines, although doing a better job than the hand method, do not materially increase production over the manual method.

After removing the jars from the heaters, the tin-foil is immediately removed because if it is left on, the jars take a brownish color. After cooling in the air between five and ten minutes, the jars are partly stripped from the cores. This is so that the jars will not warp or shrink by giving them time to set. If battery jars become set on the cores it is very difficult to remove them without frequent breakage and damage to the core. There

are several methods of removing jars from cores and some are by rather ingenious mechanical devices. The simplest is a hand method in which a tool similar to ice tongs is used, only that instead of sharp points on the ends, they have two parallel bars. With this method fewer jars are broken in removing them.

After fifteen minutes the jars are completely removed from the cores and piled neatly on the floor until they are completely cooled. The bottom and top of the jars are then ground to a finished dimension as specified by customers. This is done on either disk or belt grinders. The belt grinders are used mostly for smoothing up the jar seams. The bottom is ground first and held to a close limit in relation to the inside ribs. These ribs are important as they hold up the positive and negative plates with the separators, and the sediment created by the acid drops to the bottom, thereby eliminating short circuiting of the battery. The tops are then ground square with bottom and the seams touched up on a belt grinder, when the jars are ready for the electrical test.

Battery jars are given an electrical test of 18,000 to 30,000 volts as specified by the customer. At one time a water test was made by sealing up the jar and putting it under approximately 4 pounds' pressure. This test has long been disregarded. The following elongation and tensile strength test and standard test piece was adopted August 27, 1918, by the Hard Rubber Division of the War Service Committee:

ELONGATION AND TENSILE STRENGTH.

The elongation is to be based on a 3-inch measured test section. Measurement must be made before test sample is put into the testing machine. Either dividers or extensometers applied to the test piece at the ends of the measured length may be used to measure elongation. The dividers or extensometers used in measuring the elongation must be free from, and independent of, the testing machine or any movement of the heads.

The tension test is to be made in a Tinius Olsen, or similar testing machine of suitable capacity.

The rate of speed of the separation of jaws shall be uniform and shall be between 1/10-inch and 2/10-inch per minute. The test pieces before breaking shall be immersed in water for one hour at a temperature of 70 degrees F. Battery jar test pieces are to be broken in testing machine room temperature of between 70 and 80 degrees.

CLAIMS FOR REHEARING.

Rejected material and samples of it will be held for one month from date of test report. Accordingly, in case of dissatisfaction with the result of test, the shippers must make claims for rehearing, should they desire it, within that time. Upon application for rehearing, the shipper may send a representative who may sort the rejected jars, accept as rejected such jars as he desires, and submit for further test the balance claimed within the specification. Such balance shall be tested in the presence of the shipper's representative, the samples being paid for by the shipper.

For such reject five jars shall be selected at random from each thousand, or from each lot, and should the average of test meet the specifications, the lot tested shall be accepted. This does not apply to individual rejections.

After passing the various tests the jars are ready for shipment.

REPAIRING DEFECTIVE JARS.

Some jars that are defective or those that are rejected can be repaired very easily. If a jar does not stand up to the electrical test, a hole is burned in it. This is caused by some minute particle of dust or metal. The jar can be repaired by filling up

the hole with gutta percha and revulcanizing with a small electric vulcanizer. If the jar is warped or under size, it can be straightened and stretched by placing it on the steam-table until it is soft, when it is straightened by forcing it gradually over the core on which it was made.

PROPOSED TENTATIVE METHODS FOR TESTING TEXTILES.¹

TYPE OF MACHINE.

1. TEXTILE TESTING MACHINES shall be of the inclination balance or pendulum type.

TESTING MACHINE CAPACITY.

2. In selecting the proper capacity of testing machine for a given fabric, the maximum capacity of the machine shall conform to the following:

Breaking Strength of Fabric, Pounds.	Maximum Machine Capacity, Pounds.
0-25	50
10-50	100
20-100	150
50-200	300
50-300	400
250-650	800

ANGLE OF PENDULUM.

3. The maximum angle of swing of the pendulum shall be 40 degrees from the vertical.

RATE OF LOADING.

4. The rate of loading in textile testing machines shall be 250 pounds per 1 inch of traverse of the head jaw.

TYPE OF JAW.

5. The jaws in textile testing machines shall be of the flat anvil type, both anvils being free to swing on a horizontal axis. The anvil faces shall be smooth and no friction cloth shall be used. The anvils shall be closed at a uniform and invariable pressure by means of an eccentric and lever.

CRIMP.

6. Crimp shall be defined as the difference in distance between any two points on a yarn in a fabric and the same two points after the yarn has been removed and straightened. This difference shall be reduced to percentage of the yarn length as it lies in the fabric.

OFF-SQUARE.

7. The percentage of warp crimp minus the percentage of filling crimp shall be defined as the off-square of the fabric.

METHOD OF DETERMINING CRIMP IN TIRE FABRIC.

8. Threads for crimp test shall be taken from the inside edge of test piece as near the center line of the roll as possible. Threads for crimp test shall be laid out by marking across them in the fabric parallel lines not less than 6 inches apart. An even number of threads not less than four in number shall be taken for each warp and each filling test. These threads shall be raveled from the fabric after marking, allowing about 2 inches extra on each end of the threads beyond the marks. The threads shall then be straightened by a machine which applies a constant load of 75 grams and the length between the original markings shall then be read in terms of the yarn length as it lay in the fabric.

¹Published by courtesy of the American Society for Testing Materials. Report of Committee D-13, read at the annual meeting of the Society at Asbury Park, New Jersey, June 22-24, 1920.

The machine shall be equipped with a dial or scale so arranged as to read the percentage crimp directly.

THE INTERNATIONAL CHAMBER OF COMMERCE.

The first meeting of the International Chamber of Commerce was recently held at Paris, France. Some 500 delegates from the five countries that participated last fall in the International Trade Conference—Belgium, Great Britain, France, Italy and the United States—were in attendance. An organization was effected and officers and directors elected. Business interests in other countries will be taken into membership later.

The meeting gave the delegates an opportunity to take up many questions of international business relations. The more important matters on which action was taken were as follows:

Restoration of international credit, based on fixation of the amount and the conditions of payment for the debts of all countries, allies or enemies; allied states should agree to fix definitely the amount and conditions of payments according to the stipulations in the treaty; avoidance of duplicate taxation of wealth of individuals or organizations in more than one country; reduction of unnecessary expenditures of local and national governments; reciprocal international treaties relative to import and export taxes; an international credit bureau was planned; national and local chambers of commerce requested to cooperate with their governments to reduce national and local governmental expenditures; governments and banking, commercial and industrial associations in all countries urged to cooperate with the International Chamber and with each other to reduce importation of non-essentials by countries whose exchanges are depreciated, and to increase exportations from such countries; endeavor to obtain the cooperation of labor to prevent delay in the turn-around of ships, delay between ships and trains, and delay in transportation by rail; restriction upon countries whose exchanges are depreciated issuing foreign loans; a reconstruction special committee to study the exchange situation; inducement of foreign investments in home countries; encouragement of tourists through removal of unnecessary restrictions; facilitation and simplification of passport procedure; committee to investigate the mischievous use of trade names and of misleading indications; common nomenclature for customs tariffs of the allied nations; revocation of import and export prohibitions as soon as internal conditions of each country will allow; petition to the Board of Directors to establish a central bureau for international statistics covering production with forecast of output and probable needs of each country; utilization of hydro-electric power, development of measures for the use of mineral fuel scientifically and economically, and development to the utmost of research in the extraction of coal and oil resources of the world.

The full meeting expressed an opinion that Germany had not demonstrated an intention to fulfill its obligations to the Allies, as agreed in the Treaty of Versailles. Allied governments were urged to tolerate no further delay in the carrying out of the treaty agreements.

The next meeting of the International Chamber will be held in London, England, next June. Temporary headquarters have been established in Paris. The location of the permanent headquarters is left to the Board of Directors.

UNDER THE TRADE NAME "SWEET RUBBER CEMENT NAPHTHA," a solvent is being offered to the rubber trade that is said to give excellent service in the manufacture of rubber cement. The product is refined entirely from Bradford, Pennsylvania, crude oil. There is no mixture of any kind. It has a very sweet odor, an initial boiling point of 112 degrees F. and a final boiling point of 326 degrees F.

Construction of Steam Hose.¹

By John M. Bierer.²

STEAM HOSE can be constructed with a seamless machine-made tube, or with a tube plied from calendered stock. Furthermore, the hose can have for its fabric element a duck of given weight and number of plies or a combination of plied duck and one or more plies of braid. To determine whether it is more satisfactory both to user and to manufacturer to make a seamless or a plied tube, and to make a simple multiple-ply duck construction or a combination duck and braid construction, three series of tests, carried out individually and independently by The B. F. Goodrich Co., The Goodyear Tire & Rubber Co., and the Boston Woven Hose and Rubber Co., have been made, the results of which are here offered.

The actual steam hose tested by the three investigators was obviously of different material, particularly as to compounds, so it is most reasonable and enlightening to survey the different series separately in order not to make the materials a factor in any comparison of constructions.

The tests by the Goodrich experimenters endeavored to compare both seamless with plied tubes and simple duck with duck-braid construction. All samples were 1½-inch inside diameter, with tube ¼-inch thick, cover 1/32-inch thick, duck 20 ounces per square yard and braid 12½ yarn. The hose was tested in a vertical position (so as not to have condensed steam present), under intermittent steam pressures, ten hours under pressure and two hours' rest until failure.

The results of the Goodrich tests are summarized in Table I. Each result represents an average of five individual samples of each construction.

Sample B was of distinctly lighter weight than A or C, so it is not surprising that failure occurred earlier than the A and C samples, which were comparable to each other. C and D were different only in the construction of tube, so that the longer service of C was undoubtedly due to the absence of seams, joints, or plied surfaces, which tend to open up. Similarly, A and C were different in fabric construction, with the same tube, so that the better endurance of C can safely be laid to the superiority of the simple plied duck to the braid and duck construction.

It takes little studying of these experiments to notice two facts already known to many familiar with steam hose. The steam hose with seamless tube lasted about half again as long as that with a plied tube; and likewise the hose with simple duck of sufficient plies lasted about half again as long as the hose with a combination of duck and braid.

Summarizing the experiments of The Goodyear Tire & Rubber Co., there appears a series of similar results. Table II represents

TABLE I.—RESULTS OBTAINED IN TESTS BY THE B. F. GOODRICH CO.

	Sample.			
	A	B	C	D
Number of plies of duck.....	3	4	6	6
Number of plies of braid.....	2	0	0	3
Tube.....	Seamless	Seamless	Seamless	Plied
Endurance under 60 lb. pressure, hours.....	2261	964	3143	2170

sents an average of five individual samples of each construction. Comparison is offered in this series also of seamless and plied tubes, of duck and duck-braid constructions, and of expansion and contraction measurements as well. Like the Goodrich tests, the hose was tested ten hours under pressure and two hours' rest until failure.

Owing to details of manufacture, there is necessarily not found the same percentage ratios of endurance among the vari-

ous constructions that were found in the Goodrich tests, but inspection of the results will reveal certain facts more important than this detail. The hose with the seamless tube C outlasted that with the plied tube D and the hose with the simple plied duck construction C outlasted that with a combination of duck and braid E. These results, though not so strikingly shown, are in accordance with those obtained in the Goodrich experiments. A further feature should be noted, that though the expansion in lateral dimensions and contraction in length are favorable to the duck-braid construction, the difference is so small between the two styles that any real and practical superiority for the braided hose would be negligible in practice.

The next experimental data to show divergence among the constructions are those obtained at the Boston Woven Hose & Rubber Co. laboratories. In order to determine the relative value of a hose with simple plied duck and hose with a combination of duck and braid, and to determine the relative value of seamless tubes and plied tubes, the following constructions were given pro-

TABLE II.—RESULTS OF EXPERIMENTS OF THE GOODYEAR TIRE & RUBBER CO.

	Sample.				
	A	B	C	D	E
Number of plies of duck.....	2	4	6	6	3
Number of plies of braid.....	2	0	0	0	2
Tube.....	Seamless	Seamless	Seamless	Plied	Seamless
Endurance under 60 lb. pressure, hours.....	1506	1198	1624	1493	1612
Expansion of diameter in 1,000 hours, per cent.....	6.1	12.2	8.2	8.1	7.0
Contraction in length in 1,000 hours, per cent.....	1.6	3.2	3.7	3.6	1.8

longed tests. All hose was of 1-inch inside diameter, ⅝-inch tubes, 0.050-inch covers, and was tested in 3-foot lengths. Two series of tests were carried out: the first at 60-pound steam pressure intermittently 124 hours on and 44 hours' rest, the second continuously at 180-pound pressure, both until failure. Eight individual samples were tested in each series and the results summarized are an average of these:

For a given fabric construction, hose with seamless tubes A lasted about one-fifth again as long and B almost twice as long as those with plied tubes C and D. Furthermore, for the same style of tube, hose with simple plied duck A lasted half again as long and C over twice as long as those with duck and braid construction B and D.

In these tests, owing to particularly careful workmanship on the samples, failure was not due primarily to separation of the seam or joint on the inner surface of the tube. But in the ordinary process of manufacture, without such undue care and special attention, the plied tube is always a danger, and this splitting and opening up of the tube is practically a fatal objection to the success of any hose by this method. This series is a clear case of superiority of seamless tubes over plied tubes, and of simple plied duck over a combination duck and braid construction.

TABLE III.—RESULTS OBTAINED BY THE BOSTON WOVEN HOSE & RUBBER CO.

	Sample.			
	A	B	C	D
Number of plies of duck.....	6	3	6	3
Number of plies of braid.....	0	2	0	2

Endurance under 60-lb. intermittent pressure, hours.....	2607	1770	2143	950
Endurance under 150-lb. constant pressure, hours.....	67	26	62	17

CONCLUSIONS.

Three different experimental laboratories, working individually and independently, found consistent results in an effort to determine the relative values of seamless and plied tubes, and of

¹Published by courtesy of the American Society for Testing Materials. Paper read at the annual meeting of the Society at Asbury Park, New Jersey, June 22-24, 1920.

²Chemist, Boston Woven Hose & Rubber Co., Cambridge, Massachusetts.

simple duck and duck supplemented by braiding. From the data gathered, there are two conclusions concerning these relative values which are obvious and irrefutable:

1. Steam hose made with seamless tube (in practice by the tube-machine method) is superior in endurance under steam pressure to hose with tube made up of successive plies of a sheeted stock, sometimes known as a calendered tube. The hose with plied tube was found to fail by the splitting and separation of the seam necessarily formed at the surface of the tube in its construction.

2. Steam hose with its fabric constructed of successive plies of frictioned duck is superior in endurance to, and the practical equal in expansion and contract of hose made of a fewer number of plies of duck supplemented by plies of braiding.

It is most advantageous to user and to manufacturer alike to construct steam hose with a seamless tube and for its fabric element a sufficient number of plies of duck only.

SPECIFICATIONS FOR RUBBER JAR RINGS. GENERAL.

THIS SPECIFICATION covers the requirements for rubber jar rings to be used for the canning of vegetables, soups, meats, fruits, etc.

TESTS.

(a) Measurements.	Minimum.	Maximum.
Internal diameter	2.20	2.32
Width of flange28	.34
Thickness078	.09
Tensile strength	350 lbs. per square inch	
Ultimate elongation	150 per cent.	

Tensile strength and elongation determined in machine jaws separating at rate of 20 inches per minute.

PRACTICAL.

A rubber ring may meet the tests as to thickness, width of flange, and inside diameter and still be unfit for use with the cold-pack method, consequently the following practical tests should be applied.

BOILING WATER TEST.—Select three jars, one having a very even top, well fitted; one, a top somewhat warped; and one, a very poorly fitting top. Fill the jars three-quarters full with boiling water, place the rubber rings in position, partially seal the jars, place them in the water bath under canning conditions, and boil for four hours. At the close of the period, remove the jars from the bath, tighten down the clamps, permit the jars to stand over night and then open. The rubber rings when removed and examined carefully should show the indentation of the top on the ring clearly and distinctly. There should be no signs of movement of the rubber ring, and the ring should still have much of its strength and elasticity and should show no signs of cracks or cuts resulting from pressure on the jar due to the vacuum within.

STEAM PRESSURE TEST.—Select, fill, and seal the jars as for the boiling water test. Place the jars in a steam-pressure canner and sterilize for two hours under 10 pounds steam. At the close of the period permit the pressure to drop naturally and remove the jars in the same manner that canned fruit or vegetables would be removed. Press the clamps down, allow the jars to stand over night, and then open. The conditions found should be the same as specified under the boiling water test.

OVEN, or DRY HEAT TEST.—Many rubber rings are satisfactory when first manufactured, but upon aging become unfit for use. In order to apply this aging test, tie three new rubber rings to a string and suspend them in the oven at 300 degrees F., dry heat, for 1 hour. At the end of that time the rubber may show small cracks on the surface when bent back upon itself, but should not crack through.

TESTS MADE BY THE HOUSEWIFE.—The following tests may be

carried out by the housewife to determine the quality of jar rings:

(a) Tensile strength.

Fill a light-weight pail with one gallon and seven pints of water (total weight approximately 17 pounds). Place the jar ring around an empty spool; pass a wire through the center of the spool and fasten to handle of the pail; then pass the round handle of a wooden spoon or broom through the ring and lift. The ring should not break.

(b) Elongation.

Cut a six-inch piece out of a ring; take hold of the ends so that there are four inches between the fingers; stretch the piece along a ruler until the fingers are ten inches apart. The sample should not break.

(c) Twelve rings stacked should measure approximately one inch.

(d) Marking.

Packages of rings should be plainly labeled with the year of the canning season during which they are to be used. They should pass these specifications throughout the year to meet the approval of the Department of Agriculture. Rings left over may either be sold the following year in the original containers, or, if they will still pass specifications, may be repacked or relabeled. The manufacturer or dealer doing this shall assume all responsibility in redating the cartons.

WAR DEPARTMENT SPECIFICATIONS FOR RUBBER COMBS.

NO. 336-1-1, JUNE 5, 1919.

GENERAL.—The comb shall be made of highest quality black hard rubber, have an oval back, mat finish, and the entire comb rubbed to a very smooth finish so that there shall be no sharp edges on or between the teeth.

CONSTRUCTION.—See drawings, which are a part hereof.

Length, 7 inches; 10 teeth to the inch; $\frac{3}{8}$ -inch from the point of the teeth to the tip of the back. The teeth shall be 17/32-inch

CONSTRUCTION OF GOVERNMENT RUBBER COMB.

long and the distance from the base of the teeth to the tip of the back shall be 11/32-inch. Thickness of comb through heaviest part of the back shall be 13/64-inch and narrowest part, about the middle of the teeth, shall be 1/16-inch through; at the heaviest part of the teeth, near the end, shall be $\frac{3}{8}$ -inch. Thickness of the teeth through the comb shall be 5/64-inch.

WEIGHT.—Shall be not less than 9 nor more than 10 grams.

VIROL.

An organic accelerator described as being powerful, but not expensive, is the latest material in that line offered to rubber manufacturers. It is safe and can be used in any stock. Besides hastening the cure it is said both to toughen the stock and improve its aging quality.

¹Submitted to Department of Agriculture by the Department of Commerce, Bureau of Standards, Washington, D. C.

Rubber Armor for Airplane Gasoline Tanks.

RUBBER was long ago suggested as a possible defensive armor for battleships, the idea being that many projectiles would not penetrate it owing to rebound and deflection, and that holes made by those which did pierce the rubber would quickly and almost completely close again. While this dream has never materialized, one of the most vital, vulnerable and dangerous parts of airships is now being protected on the same principle with much success, and an added measure of safety and endurance has been given to Uncle Sam's bird-men by rubber.

Gasoline tanks on United States Army airplanes are being equipped with rubber and fabric coverings in order to prevent leaks in case the tank is penetrated by bullets and thus the fire hazard is reduced. There are two types of these leak-proof coverings, detachable and fixed, the former being furnished whenever practicable.

The tank or tank form is first covered with tire breaker fabric with the coated face outside. A 1/16-inch ply of pure, first-grade washed and dried smoked sheet rubber is then applied over the breaker fabric. Over the crude rubber is applied a 3/4-inch layer of rubber compound, and the three layers are rolled down into close and uniform contact over the whole surface of the tank, when the completed covering on the tank or form is vulcanized and the accessory fittings for filling the tank are installed. The coverings conform to government dimensions and a tolerance of plus 1/8-inch is permitted on overall height, breadth and length. No minus variation in the thickness of the walls is allowed. All openings for accessory fittings are reinforced with fabric strips or washers.

Coverings of the detachable type have four triangular end flaps laced together which permit insertion or removal of the tank. Attached along the edges of these flaps before vulcanization are strips of 17 1/4-ounce tire duck. These fabric strips are to reinforce the edges which hold the lacing eyelets, which are standard brass grommets.

The rubber compound from which the main body of the rubber covering is made contains not less than 92 per cent by weight of new washed and dried, hard tire Pará, or the highest grade only of new *Hevea* plantation rubber, 6 per cent by weight of sulphur, and not more than 2 per cent by weight of magnesium oxide.

The utmost precautions are taken to safeguard the quality of the materials and workmanship. The required tensile strength of the compound is at least 1,800 pounds per square inch. The elongation of a two-inch section at the breaking point is at least 700 per cent. When the specimen is stretched from two to fifteen inches, held in the stretched position for ten minutes and then released for ten minutes, the permanent elongation must not exceed 12 1/2 per cent. Great care is exercised during the

whole manufacturing process to exclude grit, dust or foreign substances from the interior of the tank.

Tensile test specimens of the rubber compound are cut with a die from samples furnished by the manufacturer, or from a sample covering. Samples are required to be approximately 3/32 or 1/4-inch thick with the constricted portion of the specimen 1/4-inch wide and having smooth edges.

DETACHABLE LEAK-PROOF COVERING FOR ARMY AIRPLANE GASOLINE TANKS.

Manufacturers are required to furnish, at their own expense, with each heat of tank coverings, a sample eight inches square of the covering made up as applied to the tank. It must be vulcanized at the same time and under the same conditions as the coverings it represents, and be guaranteed to consist of the same materials. All materials

and finished coverings are subject to inspection by the Inspection Section, Procurement Division, of the Air Service, and acceptance or approval of the materials in process does not infer acceptance of the finished product. All accepted coverings are plainly marked with the official acceptance stamp of the Air Service. The manufacturer's name or trade-mark, the Air Service production order number, style of covering and the date of manufacture are permanently impressed on the outside of each rubber covering, and the coverings or covered tanks are packed for shipment as directed by the purchaser.

The Air Service reserves the right of free access for its inspectors to all parts of the manufacturer's plant concerned in the manufacture of these coverings; also of adequate facilities for determining that the materials and coverings conform to specification, and of the opportunity to check and mark all materials in process or in stock.

The information and illustration used in this article were supplied by the Specifications and Standards Section, Engineering Division, Air Service, United States Army, Dayton, Ohio.

ADJUDICATED PATENTS.

ELYRIA NATIONAL RUBBER HEEL Co. vs. I. T. S. RUBBER Co. United States Circuit Court of Appeals, Ohio.

The Tufford reissue patent, No. 14,049, for a rubber heel, held not infringed on review of an order granting a preliminary injunction. ("Federal Reporter," volume 263, page 979.)

ST. LOUIS AS A MANUFACTURING CENTER.

The St. Louis, Missouri, Chamber of Commerce is circulating very convincing literature telling manufacturers who are contemplating a change of location, or the establishment of a branch office, just why St. Louis should be chosen.

The city's recent successes in inducing large business concerns to come there are chiefly due to central location, favorable transportation facilities and rates both by land and water, available raw materials, and the excellent living and housing conditions.

A Direct Method for the Determination of Rubber Hydrocarbon in Raw and Vulcanized Rubber.¹

By W. K. Lewis and W. H. McAdams.

INASMUCH as this paper will not deal with the structural formula of rubber, the conventional formula $(C_8H_{10})_n$ will be used to designate rubber hydrocarbon, with the understanding that this contains $2n$ double bonds. Two types of reaction are possible, involving in the first case, addition, and in the second, substitution, of bromine.

In the second reaction it will be noted that *two* atoms of bromine are necessary to substitute *one* atom of hydrogen, thereby producing one formula weight of hydrogen bromide.

This paper deals with the application of the McIlhenny method, developed for unsaturated oils, to rubber hydro-carbon. Briefly, it consists in determining by a volumetric method the substitution which does occur under the particular conditions of the analysis in question, and deducting twice the observed substitution from the bromine consumed, which gives the measure of the true bromine addition, from which the rubber hydrocarbon is readily calculated.

RAW RUBBER PREPARATION OF PURE RUBBER HYDROCARBON SOLUTION.

Plantation pale cr pe was extracted overnight with acetone in the standard extraction apparatus to remove the resins, then carefully dried, dissolved in pure carbon tetrachloride, and finally filtered to remove the proteins and other insoluble matter. The resulting hydrocarbon was analyzed by evaporation to determine the total solids present in a known volume, and this known rubber hydrocarbon content was used as a basis of comparison with the calculated figures found by bromine addition as described below.

PROCEDURE.

To a known volume of the above pure rubber hydrocarbon solution, containing approximately 0.2 g. $(C_8H_{10})_n$, a measured volume of bromine in pure carbon tetrachloride corresponding to approximately 150 per cent excess bromine above that necessary for addition was added, and the mixture was allowed to stand in glass-stoppered bottles for varying lengths of time in a dark closet at room temperature. After this exposure to bromination, 10 cc. of a three per cent potassium iodide solution were added to take up the excess bromine, and the resulting iodine was titrated by means of 0.25 normal standard sodium thiosulphate, using starch paste as an indicator. In order to determine the substitution which had occurred, 10 cc. of five per cent potassium iodate were now added to convert the equivalent of the hydrogen bromide into iodine, which was then titrated to a second endpoint. A blank was run under the same conditions as the rubber determination in order to determine the bromine added to the rubber analysis, and to eliminate any error caused by impurities in the reagents used. The sample calculation given below indicates the relations of the various ratings:

Rubber taken = 0.2000 G.	Thiosulphate Solution = 0.235 Normal
Equivalent Weight of Rubber Hydrocarbon, $(C_8H_{10})_n = 34$	
	Cc. Thio.
For blank	70.00
Excess found by first titration	38.00
Consumed	32.00
Twice second titration, (2×35.5)	71.00
True addition	25.00
$25.00 \div 34 \times 0.235 \times 100$	
0.2000×1000	
	= 100 per cent theoretical addition

Notes. In order to avoid loss of bromine vapor upon opening the bottle after the bromination period, the bottle was cooled by immersion for a few minutes in ice water, in the dark, and the potassium iodide solution was introduced by means of 1-inch rubber tubing attached to the neck of the bottle and extending up above the stopper.

The carbon tetrachloride was purified by subjecting it to the action of saturated chlorine water for several days in diffused daylight, followed by washing with water and drying with calcium oxide, previous to a distillation in which the fraction boiling within one degree C. of the proper boiling point was taken.

VULCANIZED RUBBER.

The above results have shown the method to be satisfactory for raw rubber; it remained to adapt it to vulcanized rubber. Since carbon tetrachloride will not "dissolve" vulcanized rubber, a new "solvent" had to be obtained, and the choice was tetrachlorethane.

In addition to the rubber hydrocarbon, resins, and proteins present in raw rubber, vulcanized rubber may contain fillers and compounding materials, such as mineral oxides or salts, carbon, mineral rubber, organic accelerators, vulcanized oils (factice), free sulphur, and sulphur combined as polyprene disulfide, $(C_8H_8S_2)_n$.

The acetone extraction of the finely cut sample was made to remove not only resins but also free sulphur and other acetone soluble materials. The rubber residue was dissolved by refluxing with tetrachlorethane² for several hours, diluted to a definite volume with carbon tetrachloride, and allowed to settle, then an aliquot part was pipetted out for bromination as in Brandegee's method. The finely divided fillers were excluded from the aliquot part so taken by placing a wad of cotton in the tip of the pipette, and applying a gentle suction.

COMBINED SULPHUR PROCEDURE.

The combined sulphur was found by evaporating to dryness in a porcelain casserole an aliquot part of the tetrachlorethane solution free from insoluble matter, and determining the sulphur by the method of Davies.³ This consisted in adding 10 cc. of saturated arsenic acid solution, 10 cc. of fuming nitric acid, and three cc. of bromine water and evaporating to a sirupy consistency. (If all the organic matter is not destroyed, more fuming nitric acid is added, and the mixture again evaporated to a sirupy consistency.) After the addition of a few crystals of potassium chlorate, the solution is evaporated to dryness, heated to boiling with 50 cc. of ten per cent hydrochloric acid solution, filtered through paper, and diluted to 300 cc. with distilled water in a beaker. The sulphuric acid is precipitated as barium sulphate by the addition of barium chloride, and determined gravimetrically in the usual manner.

CALCULATION OF TOTAL RUBBER HYDROCARBON.

The rubber hydrocarbon combined with the sulphur thus found is calculated by multiplying the percentage of sulphur by

$$\frac{C_8H_{10}}{S_2}, \text{ or } \frac{136}{64} = 2.13.$$

¹Published by courtesy of the American Chemical Society. Read before the Rubber Division of the American Chemical Society, at St. Louis, Missouri, April 12-16, 1920.

²This solvent was purified in the same manner as the carbon tetrachloride.
³"Chemist-Analyst," 15 (1915), 4. THE INDIA RUBBER WORLD, October 1, 1916, page 11.

The total rubber hydrocarbon is calculated by adding the rubber hydrocarbon combined with the sulphur and the uncombined rubber hydrocarbon found from the bromine addition.

PROCEDURE FOR VULCANIZED RUBBER.

Extract a weighed sample (approximately 1.5 to 2.0 g.) of vulcanized rubber with acetone for 8 hours in the standard extraction apparatus, evaporating the acetone to obtain the percentage of acetone-soluble material.* Aspirate carbonic acid through the rubber to remove the traces of acetone, reflux four hours, with approximately 100 cc. of tetrachlorethane, cool, and make up to mark in a 250-cc. calibrated flask with carbon tetrachloride. Remove a 25-cc. aliquot portion by applying gentle suction to a pipette containing a small piece of cotton in its tip. Place this sample in a glass-stoppered bottle of 250 to 500 cc. capacity, add from a burette a measured amount of bromine in carbon tetrachloride corresponding to at least 100 per cent excess bromine above that necessary for the addition reaction, insert the stopper tightly, and allow to stand for three hours in a dark closet. At the end of this time, darken the room, add 10 cc. of 10 per cent potassium iodide solution, shake, and titrate rapidly with 0.1 normal standard sodium thiosulphate, using starch paste as an indicator. As soon as the first end-point has been noted, add 10 cc. of 1 per cent potassium iodate solution, and titrate rapidly to the second end-point with thiosulphate. The titration of a blank run under similar conditions gives the thiosulphate equivalent of the bromine added.

The method of calculation of the results is entirely similar to that used in the case of raw rubber, except that, to get total rubber, the rubber equivalent to combined sulphur is added to that determined by bromination.

RESULTS.

TABLE I RUBBER HYDROCARBON BY ADDITION.

Sample.	Individual Runs, Per Cent.			Average Per Cent.
A.....	86.2	86.6	82.2	85.5

F.....	..	Mineral rubber and accelerator	2.16	4.6	78.0	82.6	80.5	+2.1

Table II compares the percentages of total rubber hydrocarbon as found by analysis with the known figures for rubber content supplied by the compounders of the samples. In no case did the analyst have any information as to the composition of the samples. The analytical figures average low, as they should do, because of the resin and protein content of the raw rubber. The analytical results are, however, probably high for true rubber hydrocarbon, because any sulphur combining with resin, protein, or accelerator to give a product insoluble in acetone but soluble in tetrachlorethane is figured over to its equivalent of rubber, and, further, any sulphur substituting in rubber hydrocarbon

*In case "factice" (vulcanized oil) is present, it should be removed by treatment in the usual manner by extraction with alcoholic potash. This treatment was unnecessary for the samples used.

itself will increase the results. These factors are probably negligible, except for sulphur combined with artificial accelerators. Any unsaturated organic material insoluble in acetone but dissolved by tetrachlorethane will also increase the analytical results. This is probably a cause of the high figures in the presence of mineral rubber. Few compounding materials are sufficiently unsaturated, however, to be serious in this regard.

It is believed that this procedure is by far the simplest and most accurate direct estimation of the rubber content of vulcanized articles. It should prove especially useful in the evaluation of shoddies, because it shows the extent to which the unsaturation of the rubber has disappeared, due to previous vulcanizations.

Within the experimental error, the results prove that rubber hydrocarbon is unsaturated to an amount equivalent to four atoms of bromine for each $C_{10}H_{16}$, and further that "combined" sulphur reduces this unsaturation by two bromine atoms for each sulphur combined. These facts seem incompatible with any theory other than that the sulphur taken up by rubber on vulcanization is chemically combined.

£5,000 IN PRIZES FOR NEW USES OF RUBBER.

THE Rubber Growers' Association, Inc., offers the following awards for ideas and suggestions for extending the present uses or for encouraging new uses of rubber: one prize of £1,000; three prizes of £500 each; ten prizes of £100 each; a sum not exceeding £1,500 to be divided among the remaining competitors whose suggestions are considered to be of value, according to the relative value of their suggestions, but so that no competitor will receive more than £100.

Suggestions must be practical and likely to increase the demand for the raw material. Ideas will be welcomed for the application in new directions of existing processes, methods or manufactures, or for improvements or new processes which will facilitate or cheapen the production of rubber goods.

Competent judges (technical and otherwise) will be appointed to investigate and adjudicate upon the suggestions received.

All competitors must accept the following conditions:

CONDITIONS.

1. Special value will be attached to suggestions of a thoroughly practical nature, supported by reasons and detailed information likely to make them effective.
2. The relative value of suggestions which are deemed practical will depend upon the quantity of raw rubber their adoption would absorb, and special consideration will be given to practical suggestions likely to utilize rubber in large quantities.
3. No apparatus, method or process suggested is to be protected in any country by letters patent or otherwise by the competitor or the Rubber Growers' Association. Every successful competitor must be prepared, if requested by the Rubber Growers' Association, to make a statutory declaration (at the expense of the Association) that he has not made and does not intend to make, and that to the best of his knowledge and belief, except as disclosed by him in compliance with clause 5 (f) of these conditions, no other person has made or intends to make, any application for letters patent for like protection in respect of the method, apparatus, or process suggested by the competitor, and that, to the best of his knowledge and belief, the method, apparatus or process suggested is not the property of any person other than the competitor.
4. The Council reserves the right at any time to publish, test, and otherwise deal with suggestions made by any competitor, whether he receives a prize or not, in any manner which is thought likely to stimulate the demand for raw rubber, and all competitors shall be deemed to have authorized such publication, testing or dealing with as the case may be.
5. Each suggestion to bear a *nom de plume* or number, which should be placed upon the right hand corner of each page used. Particulars should be clearly and legibly written or typewritten on one side of the paper only. In submitting suggestions competitors shall give the following particulars, with such others as they deem advisable:
 - (a) A short preliminary description of the suggestion.
 - (b) As full a detailed description as possible should follow, with explanations, samples (if any), diagrams and designs to enable the suggestions to be fully adjudicated upon by the judges and, if necessary, adopted by a manufacturer.
 - (c) The facts upon which the competitor bases his belief in the value and practicability of the idea, and his special means of knowledge (if any).
 - (d) Any information the competitor may have as to: (1) The cost of manufacture of the article; (2) the probable demand for it; (3) the quantities of raw rubber likely to be utilized in its manufacture.

- (c) Whether the suggestion has been already adopted partially or wholly and by whom and when and with what results.
- (f) Whether the suggestion is, in the competitor's knowledge, in any way covered by patent laws, or has been the subject of any application for letters patent by any person, or is in any way affected by any letters patent, etc., in any country.
6. The decision of the judge or judges shall be final and binding on all competitors and will be communicated direct to all the competitors.
7. In the event of the judges considering two or more suggestions to be of equal merit, or in the event of a disagreement between the judges, power is reserved to divide the prizes.
8. Suggestions must be accompanied by a sealed envelope bearing outside the name *de plume* or number, and inside the real name and address of the competitor. Names of prize winners only will be published.
9. All competitors shall be bound by the conditions governing this competition.
10. The closing date for receiving suggestions from competitors is December 31, 1920. Envelopes will not be opened before this date.
11. Suggestions should be addressed to: The Rubber Growers' Association Prize Competition, care of Messrs. Fitzpatrick, Graham & Co., Chartered Accountants, 95a, Chancery Lane, London, W. C. 2.
- N.B.—All inquiries in connection with the competition (other than the competitive suggestions) should be addressed to The Rubber Growers' Association (Dept. C), 38, Eastcheap, London, E. C. 3.

PEACHEY'S NEW VULCANIZATION PROCESS.

By S. J. Peachey, M. Sc. Tech. F. I. C.

THE VULCANIZATION of rubber is effected at the present time by one of two methods, the hot cure, which is extensively employed in the production of the great majority of rubber goods, and the cold cure, which finds application mainly in the manufacture of thin sheet rubber goods, dipped articles and rubber proofed fabrics.

The first method consists in mixing the rubber with a certain proportion of sulphur, and heating the compound to a temperature of 130 to 150 degrees C. for a period of time, which varies with the amount of sulphur employed, and averages perhaps one to three hours.

The second process was discovered by Parkes. Its application in the industry is limited by the fact that it produces a mere surface vulcanization, and can therefore be employed only for thin rubber sheets or surfaces.

From the time of Parkes' discovery of the sulphur chloride process in 1846—three-quarters of a century ago—nothing in the nature of a chemically new method of vulcanization had been brought forward until the year 1918, when the process forming the subject matter of British Patent No. 129,826 was discovered by the writer, as the result of an investigation on the behavior of rubber towards the various allotropic forms of sulphur.

Briefly the new process consists in exposing rubber, alone or in admixture with practically any useful filling agent or pigment, successively to the action of two gases, sulphur dioxide and hydrogen sulphide. The gases diffuse into the rubber and there interacting produce a particularly active form of sulphur, which is capable of combining with and vulcanizing the rubber, even at the ordinary temperature. The reaction presumably takes place according to the equation:

Unlike the Parkes process, which yields an addition product containing both sulphur and chlorine, the new process leads to the formation, without the aid of the heat, of a sulphur addition product, comparable in every way with that produced by the hot vulcanization process.

The process is applicable not only to rubber in its ordinary form, that is to say, as an elastic or plastic solid, but also to dissolved rubber. The treatment of a rubber solution alternately with the two gases mentioned above brings about complete peccization of the solution to a jelly consisting of vulcanized rubber distributed through the solvent. On expelling the latter by evaporation a fully vulcanized rubber of excellent quality is obtained.

The new process, eliminating as it does the use of heat and of sulphur chloride, renders it possible to introduce into the rubber a large selection of coal tar dyestuffs and lakes, and even natural coloring matters such as chlorophyll, and to produce

vulcanized rubbers possessing pure and delicate shades of color quite unobtainable under the old conditions. Further, organic filling agents, such as leather waste, sawdust, wood meal, and the like, which are decomposed or partly decomposed at the temperature employed in the hot vulcanization process, or by the action of sulphur chloride in Parkes' process, can be introduced by the new method into rubber mixings, yielding cheap vulcanized products possessing new properties and a high degree of durability.

In this manner, for example, employing wood meal and a small proportion of rubber, it becomes possible to produce a new and very cheap class of material to replace linoleum and other floor coverings, with distinctly superior qualities as regards color, durability and flexibility. Similarly, by incorporating leather waste (buffings or shavings) with a comparatively small amount of rubber, and vulcanizing by the new process, it becomes a simple matter to manufacture a reformed leather closely resembling the real article in appearance and character, and possessing even greater durability. The process lends itself to the manufacture, not only of hard-wearing leathers suitable for boot and shoe manufacture, but also of delicately tinted and grained leathers for upholstery and artistic work. Further, by the application of the new solution process, the reformed leather may be built up into any desired article, the seams united by vulcanization, and stitching and riveting wholly dispensed with. In regard to cost, the new process compares very favorably with the existing processes, in that it dispenses with the use of steam and of mechanical pressure, and employs in the place of sulphur and sulphur chloride two gases which can be prepared and manipulated on a large scale at a very cheap rate. The main drawback is the objectionable smell of the gases, but the writer is assured by expert rubber engineers that this presents no difficulty in the application of the process.

What the Rubber Chemists Are Doing.

THE ACCELERATION OF VULCANIZATION.¹

THREE METHODS are available for speeding up the vulcanization process: (1) raising the temperature, (2) increasing the proportion of sulphur relative to rubber, (3) introducing an accelerator.

EFFECT OF TEMPERATURE.

The effect of alteration of temperature is similar to that for other chemical reactions, the temperature coefficient being between 2 and 3 (for 10 degrees C.). The suggestion has been made that some accelerators, lead oxide in particular, are not genuine catalysts, but that they merely react with part of the sulphur with evolution of heat, thereby raising the temperature of the reacting mass above that of the surrounding heating medium.² The insufficiency of this explanation is evident from the fact that such an effect should be almost negligible at the surface of the rubber in contact with the molds, while in the interior it would be marked; thick slabs also would vulcanize much more rapidly than thin sheets; both these consequences of the theory are contrary to experience. It is quite possible, however, that many vulcanization accelerators do exert a slight thermal effect in addition to their purely catalytic influence.

The curves given in Fig. 1 represent results of some of our experiments as to the rate of vulcanization at temperatures ranging from 138 degrees C. (35 pounds' steam pressure) to 168 degrees C. (95 pounds) for a mixture of pale crepe rubber (90) and sulphur C. (10). Pale crepe rubber was chosen as showing greater uniformity in rate of vulcanization than other forms of rubber, and was taken as far as possible from one case. For the introduction of the sulphur a stock mixing of sulphur with approxi-

degree of accuracy attainable with careful working. For the purpose of comparison between different samples an elongation of 600 per cent (including the original length) at a load of 0.5-kilo per square mm. has been arbitrarily assumed as a standard throughout this paper; (c) by the time required to produce maximum tensile strength.

The last method, although of less importance than might be expected in technical practice, is of considerable value in experimental work as supplying a convenient and rapid method for comparing rates of vulcanization, for example, of different rubbers or at different temperatures, the maximum tensile strength, determined within three days of vulcanization, being observed with a product containing approximately 5 per cent of combined sulphur calculated on the rubber. The actual value of the breaking strength of a rubber test piece is always more or less fortuitous; however, as vulcanization beyond the condition necessary for the attainment of the maximum strength causes a very rapid weakening, the position of the maximum is relatively easily determined. The peaked curves in Fig. 1 indicate the position of the maximum rather than the actual magnitude of the values.

It will be observed that the temperature coefficient manifests no tendency to any regular increase or decrease with rise of temperature, the mean value calculated (by all three methods of comparison) from the figures represented in the curves for the rubber-sulphur mixture at 128 degrees to 168 degrees C. approximating to 2.3.³ This appears to indicate that the allotropic forms ordinarily present in molten sulphur in relative proportions dependent on the temperature, must possess equal or at least comparable vulcanizing activity.⁴

FIG. 1.

FIG. 2.

FIG. 3.

mately an equal weight of rubber was used. The composition of this mixture was checked by analysis, and the correct proportion weighed out for mixing with the remainder of the rubber. In this way the almost inevitable loss of sulphur dust during the customary method of mixing was avoided.

The progress of vulcanization may be followed in at least three different ways: (a) by the combination of sulphur; (b) by the gradual decrease in the extensibility of the rubber at a definite load (or increase of the load necessary to produce a definite elongation); within the range of the experiments in this paper, this shows a roughly rectilinear relationship with the period of vulcanization. Unfortunately, this method is influenced to a greater extent than either (a) or (c) by the mechanical treatment of the rubber during mastication and the subsequent mixing operation, increased working or heating having a tendency to exaggerate the extensibility figure. The approximation of the curve to a straight line and the close proximity of extensibility values for duplicate samples are evidence of the considerable

The extent to which the vulcanization period in technical work can be reduced by raising the temperature is limited by various considerations, not the least of which is the poor thermal conductivity of rubber and the consequent danger of unequal heating, involving local irregularities in the degree of vulcanization.

INCREASE OF PROPORTION OF SULPHUR.

Many old compounding ingredients and species of the rubber trade, often bearing fanciful names, contained—undisclosed—considerable proportions of free sulphur; mixtures of sulphur with various waxes and also with antimony sulphide may be quoted as

¹By D. E. Twiss and S. A. Brazier, "Journal of the Society of Chemical Industry," May 15, 1920, page 125-127.

²Seidl, "Gummi Zeitung," 1911, 25, 710, 748.

³On account of the inconveniently rapid progress of vulcanization at 168 degrees C. and its slowness at 128 degrees C. the measurements at 138 degrees C. to 158 degrees C. are possibly to be preferred; a mean value of 2.6 is then obtained for the temperature coefficient.

⁴See Twiss, Annual Report of the Society of Chemical Industry, 1919, 4, page 327.

better class examples. As the rate of vulcanization of rubber-sulphur mixings containing less than, roughly, 10 per cent of free sulphur is directly proportional to the percentage of free sulphur, the effect of such additional sulphur-containing ingredients on the rate of vulcanization is obvious, and today is commonly realized.

For experimental work on the relative rates of vulcanization of different rubbers or on the effect of various catalysts, the selection of a mixture of rubber and sulphur containing as much as 10 per cent of the latter is advisable, not only because this quantity is more than sufficient to permit the progress of the change to well beyond the characteristic maximum strength, but also because it is sufficiently high to reduce in extent any disturbance arising from slight inaccuracies in the proportion of sulphur present. The possibility must always be borne in mind, however, that the activity of an accelerator may possibly be influenced by the proportion of free sulphur simultaneously present.

USE OF A CATALYST.

Almost all basic substances can act as catalysts to the vulcanization process, for example, magnesium oxide, lead oxide, lime, sodium hydroxide, potassium hydroxide, and also substances such as sodium amide, potassium glyceroxide and sodium phenoxide, which, by interaction with the traces of water invariably present in rubber, are able to give rise to alkalis or bases; typical examples of organic accelerators are piperidine, quinine (the crude alkaloid mixture known as "quinoidine" is commonly used) aniline, naphthylamine, *p*-phenylenediamine, hexamethylenetetramine, anhydroformaldehydeaniline, benzylideneaniline, aldehyde-ammonia, and simple carbon bisulphide or carbon dioxide derivatives of the amines, such as dimethylammonium dimethylcarbamate, the corresponding dimethyldithiocarbamate and thiocarbonyl. Compounds containing a nitroso-group substituted into an aromatic cyclic nucleus are also effective catalysts, the best known example being *p*-nitrosodimethylaniline. Clearly there is a wide range of possible accelerators of these various types.⁵ In this connection there must also be mentioned the possibility of forming catalysts in rubber during its production. If the wet rubber clot, freshly coagulated from the latex, is kept for several days before being rolled and washed, partial decomposition of the nitrogenous constituents of the retained serum sets in with the formation of organic bases. These are not eliminated by the subsequent rolling and washing, so that the resulting rubber exhibits exceptionally rapid vulcanization.

As is illustrated clearly by our results in Fig. 1, the curve representing the rate of combination of rubber and sulphur does not follow the course expected from a simple chemical reaction, but, with less than 10 per cent. of free sulphur, is approximately rectilinear until the almost complete exhaustion of the sulphur.⁶ This is probably to be explained by the occurrence of autocatalysis; with mixtures of rubber and sulphur containing more than 10 per cent of the latter, the progress of the fixation of sulphur follows the sinuous S course, which is commonly regarded as characteristic of an autocatalytic process.⁷ In the presence of an artificial catalyst, therefore, the compensation relation between the effect of the disappearance of sulphur and the extent of the increasing catalytic effect may be disturbed, so that the fixation of sulphur no longer follows a rectilinear course.⁸

Although the results as to the rate of vulcanization of a simple sulphur mixing, as decided by these three methods, are comparable, in the presence of an extraneous catalyst, this is not necessarily so. The chemical action of sulphur on the rubber induces the physical alterations which constitute the advantage to be gained by vulcanization, but the chemical and physical processes are not necessarily strictly proportionate, and some "accelerators" influence one more than the other. In the presence of certain accelerators the physical or mechanical alteration is disproportionately rapid, and the tensile strength attains its maxi-

mum⁹ at a coefficient of vulcanization (combined sulphur \times 100 \div rubber) well below the normal value of 5 (see table below).

Other accelerators, on the other hand, reduce the sharpness of the optimum, so that the peak of the curve is less pronounced. In yet other cases the catalyst may give rise to a vulcanized rubber with an abnormal extensibility relative to its coefficient of vulcanization. Most of them, but not all, by reducing the time of heating necessary, cause the production of a rubber with a higher tensile strength than would be obtained by more tardy vulcanization at the same temperature without the catalyst, and in this direction reduction of the time of vulcanization by using an increased percentage of sulphur can have a similar effect.¹⁰

The effectiveness of one of the above-named organic catalysts, namely, aldehyde-ammonia, is demonstrated with a mixture of pale crepe and sulphur (90:10), at various temperatures from 148 degrees C. (51 pounds' steam pressure) downwards, in an oil bath vulcanizer. Even at a concentration of $\frac{1}{2}$ per cent the effect is clearly observable while, with 1 per cent, vulcanization occurs so readily as to be possible in a reasonable period at 108 degrees C. (or less than 5 pounds' steam pressure); the progress of vulcanization has been recorded at 98 degrees C. It will be seen that the temperature coefficient calculated by the ratio of the speed of reaction at intervals of 10 degrees C. from 108 degrees to 148 degrees is practically the same as for the reaction in the absence of an artificial catalyst; the average value for the accelerated mixings being 2.4. This observation militates against the belief of some investigators in this field that vulcanization catalysts are not themselves able to expedite vulcanization, but that during the early stages of the process they combine with sulphur, giving rise to substances which possess the desired activity. This view may be correct in certain cases, but evidently cannot be accepted generally for all vulcanization catalysts. The average values of the coefficient with the various proportions of accelerator are given in the table:

AVERAGE TEMPERATURE COEFFICIENT.

	1% (108° C.)	$\frac{1}{2}$ % (118° C.)	$\frac{1}{4}$ % (118° C.)	$\frac{1}{8}$ % (118° C.)	Nil (128° C.)
Proportion of accelerator.					
Method of testing -					
(a) Combination with sulphur	2.4	2.3	2.4	2.3	2.3
(b) Elongation at 0.5 kilo. per sq. mm.	2.5	2.5	2.5	2.4	2.3
(c) Maximum tensile strength	2.5	2.5	2.2	2.5	2.4

It is a striking fact that although the individual values of the temperature coefficient between 108 degrees and 148 degrees C. without exception oscillate closely about the mean value of 2.4, the interval 98 degrees—108 degrees C. shows a much greater value exceeding 5.0. This is doubtless due to the melting of the sulphur between these two latter temperatures, the normal melting point being lowered under the obtaining conditions. This observation supplies a confirmation of the argument as to the comparable effectiveness of the various allotropic forms.

The fact observed above, that the temperature coefficient pos-

⁵The presence of nitrogen in all such organic catalysts of vulcanization aids their detection in rubber. The organic accelerator to a considerable extent will pass into solution on prolonged extraction with acetone and the extract consequently will show an abnormally high percentage of nitrogen.

⁶Spence and Young, "Journal of the Society of Chemical Industry," 1911, 817; 1912, 81, 785.

⁷Skellon, Rubber Industry, 1914, 172; van Iterson, "Communications of the Netherlands Government Institute for Advising the Rubber Trade and the Rubber Industry," 1916, 7, 247.

⁸van Iterson, loc. cit.

⁹This does not refer to the so-called "technical optimum" of vulcanization for which the corresponding coefficient of vulcanization in the presence of a catalyst may fall as low as 2 or 1. (Kratz and Flower, "Journal of Industrial and Engineering Chemistry," 1919, 11, 30.) The technical optimum cure is probably capable of less definite measurement than the maximum tensile strength in the type of mixing used above.

¹⁰van Rossem, loc. cit., p. 210.

asses comparable values for mixings with and without an artificial catalyst, appears from other results in our possession to be a general one for all catalysts. This facilitates the representation of the relative effectiveness of different catalysts by means of a numerical factor. A factor representing the ratio of the respective periods of vulcanization required for the attainment of a definite state of vulcanization in a rubber-sulphur mixing, with and without a definite proportion of accelerator, will be independent of the temperature; it will be essential that this comparison be made at a stage of the vulcanization process when the mixture still contains a considerable proportion of uncombined sulphur. The resulting "acceleration factor" may differ according to which of the three possible criteria—percentage of combined sulphur, maximum tensile strength and extensibility at definite load—is taken as fixing a definite state of vulcanization. In the case of the accelerator used in the experiments now quoted, the behavior may be described as normal, all three methods giving comparable results. The effectiveness calculated in this way for the accelerator at various concentrations and at different temperatures is given in the following table; the figures in each case represent the mean of the values obtained by the three different methods for the comparison of rate of vulcanization.

Stated otherwise, the presence of $\frac{1}{8}$, $\frac{1}{4}$, $\frac{1}{2}$ and 1 per cent, respectively, of the accelerator increases the rate of vulcanization at any ordinary vulcanizing temperature to 1.7, 3, 5 and $7\frac{1}{2}$ times the normal.

ACCELERATION FACTOR.

Percentage Temperature C.	$\frac{1}{8}$	$\frac{1}{4}$	$\frac{1}{2}$	1
118-128 degrees	1.7	2.8	5.1	7.5
128-138 "	1.7	3.0	4.8	7.6
138-148 "	1.7	3.0	4.8	7.1

A graphic representation of this result as to the relation between the proportion of the accelerator in question and the effect produced is given in Figure 3. The slight divergency from the course of the smooth curve of the points for the lower percentages is doubtless due to the relatively greater effect of the inevitable small loss of accelerator by vaporization during the mixing operation.

Comparison of the relative effectiveness of isomeric substances, namely *m*- and *p*-phenylenediamine as accelerators shows that the meta-compound is notably less active than its para-isomeride. It is of interest to note that the effectiveness of these two substances towards vulcanization falls in the same order as their affinity constants as determined by Bredig in 1894. The low value of the coefficient of vulcanization at the maximum tensile strength of the *p*-phenylenediamine will also be noticed.

The "acceleration factor" for *m*-phenylenediamine, calculated from the results in Fig. 3, has a mean value of approximately 1.5; for *p*-phenylenediamine judged by the physical methods the factor is approximately 3.3, whereas the rate of combination with sulphur indicates a value of only 3.0.

MIXED CATALYSTS.

The effectiveness of a mixture of catalysts in an ordinary chemical reaction is well known not to coincide invariably with the sum of the effects produced by each independently. This peculiarity is also observable with vulcanization catalysts.¹¹ Lead oxide with magnesium oxide, and *p*-nitrosodimethylaniline with aniline or one of its homologs, are cases which have already been quoted in the literature. A related phenomenon probably is also the power of zinc oxide, which alone does not accelerate vulcanization, to increase considerably the effectiveness of other organic catalysts such as hexamethylenetetramine and thiocarbonyl. As the latter by itself is practically inert, we have the interesting case of a mixture of two inactive substances exerting a distinct accelerating effect. In other cases we have found two vulcanization catalysts to be "incompatible" in the sense that the effectiveness of the more active catalyst is actually decreased by the presence of the other.

As has been intimated already, no acceptable general explanation is yet possible as to the mode of action of vulcanization catalysts. In addition to the theories already mentioned, others have also been proposed. An observation of considerable interest in this connection is that rubber in solution or wetted with benzene becomes vulcanized by successive treatment with sulphur dioxide and hydrogen sulphide at the ordinary temperature.¹² This reaction appears to be very suggestive in connection with the action of vulcanization catalysts. None of the three modifications, S_2 , S_8 , and S^* present in liquid sulphur appears to be in possession of exceptional chemical activity towards rubber (see above), but there is evidently a possibility that there is capable of existence yet another form of sulphur of much greater vulcanizing power. Such a view, needing considerable modification however, has already been tendered¹³ but the scope for investigation in this direction is enormous; indeed, the evidence available as yet is insufficient even to exclude the possibility that vulcanization accelerators may activate the rubber and not the sulphur.

CHEMICAL PATENTS.
UNITED STATES.

METHOD OF COLORING FIBROUS MATERIAL.—The process of coloring and rubberizing fibrous material, which comprises dipping the material into a solution of potassium antimonyl tartrate and a solution of a sulphide of ammonium, whereby antimony sulphide is formed directly in or upon the fibers of said material, and coating the material with a vulcanizable plastic compound. (Willis A. Gibbons, Flushing, New York, assignor to American Rubber Co., Boston, Massachusetts. United States patent No. 1,332,982.)

ARTIFICIAL RUBBER.—An elastic composition comprising glycerin, two and one-fourth pounds; glue, five and five-eighths pounds; water, nine pounds; tannic acid, two and one-fourth ounces; and a solution of formaldehyde, four ounces. (Ernest E. Cathcart, Tecumseh, Nebraska. United States patent No. 1,335,657.)

PROCESS FOR VULCANIZING RUBBER AND PRODUCT OBTAINED THEREBY.—A process for treating rubber or similar material which comprises adding thereto a dye, a vulcanizing agent normally tending to injure the coloring material under vulcanizing conditions and an agent itself having no injurious effect upon the coloring material and adapted to prevent injury by said vulcanizing material and inducing vulcanization to take place. (Iwan Ostromislensky, Petrograd, Russia, assignor, by mesne assignments, to New York Belting & Packing Co., New York. United States patent No. 1,342,457.)

PROCESS FOR VULCANIZING RUBBER AND PRODUCT OBTAINED THEREBY.—A process for treating rubber or similar material, which comprises subjecting the rubber to the action of sulphur and an organic vulcanizing agent containing oxygen and inducing vulcanization to take place under the action thereof. (Iwan Ostromislensky, Petrograd, Russia, assignor, by mesne assignments, to New York Belting & Packing Co., New York. United States patent No. 1,342,458.)

RUBBER VULCANIZATION AND THE PRODUCT.—The process of accelerating the vulcanization of rubber, which consists in vulcanizing the rubber in the presence of a compound of the amine bases produced from beet sugar residue combined with carbon disulphide. (Stuart Benton Molony, Wellesley Hills, Mass., assignor to Michigan Chemical Co., Michigan. United States patent No. 1,343,224.)

¹¹Dittmar, "Gammi-Zeitung," 1915, 29, 424.

¹²Peachey, "Journal of the Society of Chemical Industry," 1919, 688a.

¹³Dubose, THE INDIA RUBBER WORLD, 1918, November 1, 78; 1919, February 1, 248.

THE DOMINION OF CANADA.

ART OF VULCANIZING CAOUTCHOUC.—The process of effecting the curing of rubber which consists in first bringing together under reacting conditions sulphur and paratitroso-dimethylaniline in the presence of an excess of aniline to produce a sulphur nitrogen accelerator, and subsequently incorporating the latter in the caoutchouc mix and vulcanizing it.

The process of effecting the curing of rubber which consists in first bringing together under reacting conditions sulphur and thiocarbamide or derivative thereof to produce a sulphur nitrogen accelerator, and subsequently incorporating the latter in the caoutchouc mix and vulcanizing it.

The process of effecting the curing of rubber which consists in first bringing together under reacting conditions sulphur and proteids or nitrogenous derivatives thereof to produce a sulphur nitrogen accelerator, and subsequently incorporating the latter in the caoutchouc mix and vulcanizing it. (The Goodyear Tire & Rubber Co., assignee of Clayton Wing Bedford, both of Akron, Ohio, U. S. A. Canadian patent No. 201,277.)

THE UNITED KINGDOM.

BOTTLE AND LIKE CAPSULES. A solution of the chlorine derivative of the basic synthetic organic dyes is first applied to the bottle or other article, and then a medium which will cause the diurene to precipitate is applied, any remaining solvent and precipitant being afterwards allowed to evaporate. The diurene may be dissolved in benzene or other solvent, and the neck of the corked or stoppered bottle dipped into the solution and afterwards into methylated spirit or other precipitant. (A. Lamble and United Alkali Co., Cunard Building, Liverpool. British patent No. 141,220.)

COLORING AND VULCANIZING INDIA RUBBER. The color bases of the basic synthetic organic dyes are mixed with natural or artificial caoutchouc or caoutchouc-like substances and sulphur, and the product is vulcanized under heat. These color bases act either as accelerators or as coloring agents, or both. In an example 57 parts of rubber are mixed with 40 parts of zinc oxide, three parts of sulphur, and one part of the color base of the basic dye auramine-O. Other dyes mentioned, of which the color bases are used, are: methyl violet B, methylene blue, Bismarck brown, magenta, rhodamine B, benzoflavine, safranin, Meldola's blue, thionine blue, thioflavine T. (L. Gaisman, Spring Bank House, Woodley, Stockport, Cheshire, and J. L. Rosenbaum, 11 Trafalgar Square, Ashton-under-Lyne. British patent No. 141,412.)

THE FRENCH REPUBLIC.

RECLAIMING RUBBER.—Improvements in process for reclaiming rubber. (Xylos Rubber Co., Limited. French patent No. 503,661.)

GERMANY.

INCREASING ELASTICITY OF VULCANIZED ARTIFICIAL RUBBERS.—(Farbenfabriken formerly Friedrich Bayer & Co., Leverkusen, near Köln am Rhein. German patent No. 301,757.)

PROCESS OF MANUFACTURING PLASTIC RUBBER-LIKE MASSES.—The liquor which settles out in the saponification of resins is purified by sedimentation or filtration, then treated in a stirring vessel with dilute sulphuric or hydrochloric acid in a finely-divided state, while heating at about 100 degrees C. The resulting mass is slightly acid, insoluble in water, soluble in alcohol, ether, and caustic alkali; it is plastic when warm and brittle in the cold. (P. B. Ribot, Schwabach. German patent No. 315,847.)

PLASTIC COMPOSITION.—Formation of rubber-like masses out of cellulose waste by adding emollients. (Franz Clouth, Rheinische Gummiwarenfabrik, Köln-Nippes. German patent No. 324,944.)

DENMARK.

ARTIFICIAL RUBBER.—Resin is melted, especially the balsam and refuse resin, with addition of calcium chloride, and the mixture is distilled with continued addition of calcium chloride and calcium chlorate, and the rubber-like mass is mixed with rubber or rubber regenerates freed from factice, tar or the like, and then vulcanized. (F. de la Rosée. Danish patent No. 24,565.)

HOLLAND.

ARTIFICIAL RUBBER.—Stearate of aluminum, manganese, chromium or iron is dissolved in hydrocarbon and introduced into linoleum at 200-300 degrees C. (Ali-Cohen, Dutch patent No. 3,293.)

NORWAY.

TREATING VULCANIZABLE PLASTIC MATERIALS.—Consisting of admixing the vulcanizing agent and subjecting the combination to vacuum. (Rubber Regenerating Co. Norwegian patent No. 29,803.)

LABORATORY APPARATUS.
DIAL GAGE FOR SHEET RUBBER.

A modified form of the customary upright dial gage for sheet rubber is shown in the illustration. The pressure of the disk on the stock is regulated by removable weights on a spindle, instead of by a spring. This feature gives the instrument adaptability in gaging soft stocks and for that reason the gage is finding favor with rubber manufacturers. (B. C. Ames & Co., Waltham, Massachusetts.)

RUBBER THICKNESS GAGE.

LABORATORY DISH.

A standardized weighing dish for laboratory purposes has lately been perfected and made the subject of a recent patent. The method of standardization follows:

A standard weight is decided upon for the dish which may be selected by averaging the weight of a number of dishes. Each dish is then very carefully and accurately weighed

STANDARDIZED WEIGHING DISH.

with the equalizer attached. If the dish is found to be above the standard weight previously selected, the cap of the equalizer stud is ground to remove sufficient metal to bring the weight of the dish exactly to the standard selected. If the weight of the dish is below this standard the cap is removed from the stud and powdered lead placed in the container in sufficient quantity to bring the weight to the standard selected. (Mojonnier Bros. & Co., Chicago, Illinois.)

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS" AND "RUBBER MACHINERY," by Henry C. Pearson, should be in the library of every progressive rubber man.

New Machines and Appliances.

AUTOMATIC CORD TIRE BUILDING MACHINE.

DUE to the novel method employed in carcass construction, the production capacity of this machine, it is claimed, will average 25 tires per hour. Moreover, the construction permits the saving of materials that are wasted in ordinary cord tire building processes. The specifications for the tire provide for individual cords tensioned to absolute uniformity throughout the process of twisting the separate strands comprising the cabled cord and in the final cabling thereof. The individual strands are

THE DICKINSON TIRE BUILDER.

thoroughly impregnated with rubber compound that precludes frictional movement within the body of the cords.

The cords are laid on the core in a series of strips made up of a number of parallel cords formed in cross-section to compensate for the variable circumference between the bead and crown, and uniformly covering the full superficial area. The strip-cords are equally distributed on helicoidal lines representing the shortest path between the opposite beads in accord with the angle at which the cords are laid, so that each cord occupies the same relative angular position and bears its full proportion of the stresses and strains of service.

To form the cord strips that give the progressive increased width from bead to crown, the contour of the cord varies from cylindrical to elliptical, but the displacement is accomplished without rupture of the fibers and the original strength is not impaired. All cords are insulated to prevent frictional contact between them in the separate plies and between the cord plies themselves. To eliminate multiple frictional surfaces two plies only are used, as more plies increase the cross-sectional circumference between the first and succeeding plies, amplify frictional action and impose strains on the cords in attempting to meet the constantly changing conditions in the flexing of the tire in service.

The machine is practically automatic in operation, as the operator has only to do with starting, stopping, supplying the necessary material, setting the cores in place and removing them with the finished carcass thereon. The present type machine lays

fifteen cords simultaneously in units of five cords each at three points over the core, one hundred and twenty degrees apart, the cords being fed from fifteen reels or bobbins through tensioning apparatus, imparting to each cord a fixed stretch or tension, automatically controlled to insure uniformity. Each unit of five cords is carried through a forming die in which pressure is applied throughout the strip length to obtain the required progressive shape to cover the variable area between bead and crown.

From the die the strip is fed to a swinging arm having grips at each end by which the strips are held under fixed tension. In this position the strip is cut to a predetermined length, in which there is no further trimming, thus obviating waste material. The arm is then swung over the core in position to lay the cord strip at the desired angle over the core. The cord strip is next transferred to laying fingers which carry each end in its path around the core; this path being mechanically regulated, there can be no deviation from it; therefore, each strip occupies the same relative position and the initial tension of the cord has been maintained throughout. Placing the bead then follows, after which the strip ends are brought around the bead toe and under it, the ends presenting a line parallel to the bead toe and heel, midway between them.

Laying the second ply is accomplished in the same manner as the first, the strip ends being laid under the bead heel, abutting the ends of the first ply and parallel thereto, thus providing angular locks, under mold pressure, preventing any slippage of the cords whereby the tension is relieved (Dickinson Cord Tire Corporation, 250 West 54th street, New York City.)

RUBBER BUFFING MACHINE.

Flexible shaft buffing equipment has come into use more recently in tire factories through its utility in removing small imperfections in finished tires, and for eradicating the name and serial number from defective tires.

In tire rebuilding and repairing, these machines are in-

FLEXIBLE SHAFT BUFFER.

valuable for buffing the inside of the casing to prepare it for the reliner or inside repair. For repairing giant pneumatic tires, buffing tubes, and tool grinding, this portable device is of much practical use.

The machine here shown is furnished complete with a $\frac{1}{4}$ -h.p. motor, 10 feet of cord with plug to attach to the electric lighting socket, five feet of 7/16-inch flexible shafting, grinding wheel, and felt buff. (R. G. Haskins Co., 27 South Desplaines street, Chicago, Illinois.)

IMPROVED AUTOMATIC MILL AND MIXER.

Enclosed, automatic rubber mixers are now accepted as standard equipment in rubber mills. The machine here shown has demonstrated its efficiency in breaking down crude rubber and mixing compounds maximum quantities.

No. 9 BANBURY MIXER

The mixer consists of an enclosed trough, in which operate rotating blades of special construction, both trough and blades being hollowed for cooling and heating purposes. The rubber and compounding ingredients are fed into a hopper and the finished batch is discharged by the turn of a valve, through the door at the bottom of the machine.

A recording thermometer records the

temperature of the mix and also shows how many batches are mixed daily, and a timing device indicates by sight or sound when the batch is finished.

These mixers are made in two sizes, No. 3 and No. 9. The former will handle a batch of approximately 150 pounds of 1.5 gravity stock, and the latter, 450 pounds. Individual motor drive is commonly used but the machines may be driven from the mill line. (Birmingham Iron Foundry, Derby, Connecticut.)

COMBINED TIRE BUILDING MACHINE AND LOOM.

This machine makes it possible to begin the construction of a tire carcass on the doubling and twisting machine, where each tread, before becoming a part of a cord, is drawn through

THE SCHAFER AUTOMATIC TIRE BUILDER.

rubber solution and impregnated, insuring a thorough distribution of rubber throughout the fabric, thus contributing largely to the elimination of one of the troubles that usually cause separation of the plies, internal friction and blow-outs.

After being rubberized, the threads are ingeniously woven on a magnetically operated loom and formed into a fabric on a double curve to approximate closely the final position of the fabric in the tire, as regards curve of the walls and circumference of the tire.

The saturated threads are then passed over electrically warmed pads that make them soft and sticky, when the skim-coat rubber is fed between the rolls and adheres to the warmed rubber of the plies, welding them closely together and insuring the expulsion of air.

The carcass made by this machine is unique in that it does away with all laps or joints. There is one continuous ply from start to finish, in which the distribution of warp threads may be regulated to give varying strengths for first ply, bead section, etc. The fabric contains one starting and one finishing end, with no waste of fabric, there is no trimming, and but little auxiliary stitching.

These machines will make tires up to 34 by 4 inches, with a capacity of two tires per hour, it being assumed that one man will be able to take care of eight machines and thus turn out sixteen tires per hour. (Automatic Tire Machine Corporation, Buffalo, New York.)

MACHINERY PATENTS.**MACHINE FOR BUILDING CASINGS AND TUBES.**

THIS machine is provided with a rotatable annular channel-shaped form within which the tire casing or tube is built. Two annular portions secured together and arranged to be separated after the tire is built permit the removal of the tire from the form; a stitching device stretches the material from which the casings are formed, as it is placed within the form and shapes the tire casing.

The tread portion and side walls of the casing are first placed

BANNER TIRE BUILDER.

within the form after which the breaker strip is placed upon the tread or if desired the breaker strip may be applied to the tread before placing in the form. The form is preferably operated at a slow speed by depressing the treadle *A*, rocking the lever *B* into position to move friction roller *C* into engagement with the belt, and thus slowly rotating the form.

The fabric or cord is then placed within the form, and the stitching wheel *D* operated to press the fabric within the side walls and tread portion of the tire. The cushion strip being

placed in the form, the inner plies of cord or fabric are then stitched upon the inner surface of the tire.

If it is desired to operate the form at a comparatively fast rate of speed, the treadle *E* is depressed, moving the friction roller *C* out of engagement with the belt and throwing the friction roller *F* into engagement with the belt.

These inner cords or fabric may be composed of any desired number of layers according to the size or type of tire to be built. The beads are then placed in their proper position and the remainder of the cord or fabric plies placed over the beads and stitched in place by the stitching wheel.

After the tire is thus built up the form is separated and the tire removed and finished by vulcanization in the usual manner. (William R. Major and Frank H. Grove, assignors to the Banner Machine Co., Columbiana, Ohio, United States patent No. 1,343,399.)

OTHER MACHINERY PATENTS.

THE UNITED STATES.

- N O. 1,342,646. Rubber core tensioning mechanism for braiding machines. F. W. Plumb, assignor of Narrow Fabric Co.—both of Wyoming, Pa.
- 1,342,916. Repair vulcanizer. S. Keuchen, New Haven, Conn.
- 1,342,970. Last for rubber boots. R. B. Price, New York City, assignor to The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Conn.
- 1,343,121. Flexible coupling for adjacent ends of shafts. W. J. Francke, assignor to The Francke Co.—both of Highland Park, N. J.
- 1,343,377. Apparatus for treating vulcanizable rubber in sheets to reduce shrinkage. J. J. Shea, assignor to The Hartford Rubber Works Co.—both of Hartford, Conn.
- 1,343,413. Flexible coupling device with interposed floating ring, etc. R. A. Smith, Mahwah, and J. J. Sorrell, Elizabeth, assignors to Smith & Sorrell, Mahwah, a partnership—all in New Jersey.
- 1,343,425. Mold for mechanical goods. C. P. Whistler, assignor to The Miller Rubber Co.—both of Akron, O.
- 1,343,460. Apparatus for opening tire molds, etc. Colin Macbeth, Birmingham, assignor to the Dunlop Rubber Co., Limited, Westminster—both in England.
- 1,343,504. Collapsible core for tires. A. H. Hayris, Barborton, O.
- 1,344,313. Expanding core for tires. O. A. Peterson and O. M. Brancel, Minneapolis, Minn.
- 1,344,702. Mandrel for making inner tubes for pneumatic tires. F. K. McCarty, Erie, Pa.
- 1,344,838. Tire repair tool. C. Wieland, Yankton, S. D.
- 1,344,847. Repair vulcanizer for tire side walls. J. W. Arthur, assignor to The Williams Foundry & Machine Co.—both of Akron, O.

REISSUES.

- 14,879. Apparatus for manufacturing tires or inner liners. W. F. Ray, Chicago, Ill. (Original No. 1,292,052, dated January 21, 1919.)

THE DOMINION OF CANADA.

- 200,584. Device for securing couplings to flexible hose. J. R. Ruse, Spencer, W. Va., U. S. A.
- 200,666. Expandable core for tires. E. A. Krannich, Chicago Heights, Ill., and L. A. Andrege, Mansfield, O., each an assignee of $\frac{1}{2}$ interest, both in the U. S. A.
- 200,687. Apparatus to resolve rubber boots. J. Ancil and J. O. Landry, coinventors, both of Montreal, Que.
- 200,860. Tire vulcanizing press. The Dunlop Rubber Co., Limited, Westminster, County of London, assignee of Colin Macbeth and H. Willsaw, Birmingham, County of Warwick—all in England.
- 200,863. Apparatus for vulcanizing tires. Firestone Tire & Rubber Co., assignee of C. A. Myers—both of Akron, O.
- 201,157. Repair vulcanizer. E. Fetter, Baltimore, Md., U. S. A.
- 201,259. Pneumatic shoe press. The Canadian Consolidated Rubber Co., Limited, Montreal, Que., assignee of C. J. Stuart, New Haven, Conn.

- 201,463. Machine for making pneumatic tire covers or casings. The Dunlop Rubber Co., Limited, Westminster, County of London, assignee of Colin Macbeth and C. K. Jones, Birmingham, County of Warwick—all in England.

THE UNITED KINGDOM.

- 138,915. Apparatus for treating rubber for removal of moisture. Hunter Dry Rile Co., 2571 Cornell avenue, assignee of H. Hunter, 2802 Ashland avenue—both of Indianapolis, Ind., U. S. A. (Not yet accepted.)
- 141,210. Apparatus for recovering volatile solvents, especially in the rubber industry. D. V. Plumbridge, Holmewood, South Kildworth, near Rugby, Warwickshire.
- 141,421. Apparatus for drilling, turning, or analogously treating studs for pneumatic tires, etc. B. Clews, 37A, Agamemnon Road, West Hampstead, and H. M. Petersen, 46 King's Road, Willesden Green—both in London.
- 142,368. Apparatus for making pneumatic tires. E. Hopkinson, 1790 Broadway, New York City, U. S. A.

GERMANY.

- 324,972. Apparatus to cut out rubber heels, soles, and strips for shoes and other rubber articles. Wood-Milne, Limited, Gaythorn, Manchester, England.

PROCESS PATENTS.

THE UNITED STATES.

- N O. 1,344,503. Manufacture of composite soles for boots or shoes, having cord fabric incorporated therein, with ends of cords presented to wearing surface. J. E. Grosjean, Lima, assignor by direct and mesne assignment of $\frac{1}{4}$ each to L. F. Montgomerie, Fort Recovery, and F. L. Mare, Lima—all in Ohio.

MACHINES FOR VARNISHING AND VULCANIZING AUTO TOP FABRICS.

In the manufacture of auto top fabrics the success of the final varnishing and curing processes is largely dependent on certain machines of special design and construction.

Double texture fabric is not

varnished and is not sticky when ready to be cured, the festooning machine shown in Fig. 1 is utilized. This is shifted in front of the vulcanizer and two rolls of double-texture fabric are placed in the machine which delivers the sheets, one upon the other, in festoons into the heater.

Single texture fabrics are first calendered or coated on a spreader and then varnished and cured, the two latter operations being performed on the apparatus shown in Fig. 2. This machine takes the fabric from the roll, varnishes it and delivers it into the heater in festoons of single sheets. (Cyrus Currier & Sons, Newark, New Jersey.)

FIG. 1. DOUBLE TEXTURE FABRIC FESTOONING MACHINE.

FIG. 2. SINGLE TEXTURE FABRIC VARNISHING AND FESTOONING MACHINE AND DRY HEAT VULCANIZER.

New Goods and Specialties.

LATE AUTOMOBILE FAN BELTS.

THE DEVELOPMENT of the automobile business has apparently resulted in multiplying the number of accessories on the market, and many of these employ rubber in some form in their composition or construction. The automobile fan belt often is in this class and two of the late types are illustrated herewith. The upper one is the newer of the two and is an endless V-belt made like a cord tire, molded to fit the pulley, thereby minimizing the tendency to slip. The cross-sectional view shows the construction of this belt, which is made in standard sizes to fit passenger cars, trucks, or tractors.

The picture below shows a magnified view of a section of a bias-woven fan belt. Being woven on the bias makes it elastic and gives it a firm grip on the fan pulley, assuring the user of its always remaining tight. This belt is made under a United States patent granted to Charles C. Gates, the inventor, for what is known as the "Vulco-Cord" process. (Gates Rubber Co., Denver, Colorado.)

"Vulco-Cord"
V-Fan-Belt.

THE "EVERLOC" HOUSEHOLD PATCH.

A patch that will mend the ordinary articles of fabric, leather, or rubber, such as rubber shoes, automobile tops or tires, footballs, umbrellas, etc., is called the "Everloc." In addition, there is a cobbler kit containing self-vulcanizing patch material in a strip. (Everloc Sales Co., Minneapolis, Minnesota.)

"Vulco-Cord" BIAS BELT

THE "BIG" AND THE "LITTLE" IN MOTOR TRUCK TIRES.

The big tire shown here is the "Samson," 40 by 12 inches, weight approximately 400 pounds, believed to be the largest solid motor truck tire ever made in Canada. The smaller one is a 3½-inch tire, shown for the sake of comparison. It is claimed that the 12-inch tire contains a greater proportionate volume of rubber than any other and that it is exempt from such troubles as splitting and coming loose from the steel base. Some idea of the tremendous undertaking involved in manufacturing a tire of this size can be gained from the fact that the mold equipment necessary to handle it weighs approximately two tons. While the manufacturer will continue to make the 6 and 7-inch dual tires, it is sure that better service is obtained from the use of single "Samsons," because what is practically combining the duals into one single broad tire offers greater cushioning and carrying capacity. The 12-inch "Samson" will carry a load of 10,000 pounds as against an 8,000-load for the 6-inch dual, while the 7-inch dual carries the same, 10,000 pounds. The company will next produce a 14-inch "Samson." (Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario, Canada.)

BIG AND LITTLE "SAMSONS."

GOGGLES TO GUARD AGAINST DUST AND POWDERS.

The King "Dustsafety" C goggle is designed to protect against dust and powders. The rigid aluminum cups are bound with rubber composition, as is also the connecting chain. The C.

THE KING "DUSTSAFE" C GOGGLE.

model has ventilating side ports and elastic straps for adjusting and fastening. (The F. W. King Optical Co., Cleveland, Ohio.)

A METER TO MEASURE TRUCK LOADS.

To prevent overloading, with consequent damage to motor trucks, tires and especially to the highways, the Loadometer has been invented. It is a portable instrument having a screw jack mounted on its plunger. The base of the instrument is an oil-filled cylinder in which the plunger operates, and the weight carried by the plunger is indicated on a high-pressure gage connected to the oil chamber.

By placing a pair of Loadometers under the rear axle of a truck where the greatest weight is carried and jacking up the rear wheels clear of the ground, the maximum load per inch of tire width is easily determined. The jack handles can be readily detached from the instrument so that a pair of Loadometers can be easily carried about in a small automobile. County and state road commissioners are using these devices extensively to prevent abuse of improved roads. (The Black & Decker Manufacturing Co., Baltimore, Maryland.)

THE B. & D. LOADOMETER.

THE "SLAPATCH" FOR LARGE BLOW-OUTS, HAS LIVE RUBBER SELF-adhering surface which holds patch to inside of tire casing and double weight canvas back, while canvas flaps fit under rim. (The Wilson Rubber Co., Des Moines, Iowa.)

RUBBER BLOOMERS FOR CHILDREN.

The "Everychild" wading bloomer is a recent product on the market. It is made of good heavy rubber stock, in three fast colors—blue, red, and green, in three sizes—small, medium, and large, for children from three to ten years of age. Elastic is cemented within the hems at the waist and legs so that there is no bother with strings and buttons—something both children and mothers will appreciate. The garment is well shaped, being made in two pieces, with cemented seams, and is decidedly good looking, due to the excellent grade of rubber used in its manufacture.

"EVERYCHILD" RUBBER WADING BLOOMER.

The "Everychild" bloomer may be slipped on over the child's clothes, thus forming a needed protection, whether in playing or wading. The child thus clothed may sit on the beach in the sand without danger of a wetting if a wave creeps up suddenly. One of the advantages of this bloomer is that it requires no washing except dipping in clear water. (Arthur Frankenstein & Co., 514-516 Broadway, New York City.)

"SUPER PATCH RUBBER-TITE" TUBE REPAIR OUTFIT.

An outfit for repairing inner tubes includes patches of high-grade, properly cured red rubber, to which is added a cloth protector, and a tube of cement, all contained in a small can with a screw-top. It is claimed for this patch that it cannot leak, will not creep, and stretches with the tube. (The Polson Rubber Co., Cleveland, Ohio.)

"WISCO" BASKET-BALL SHOE.

rubber vacuum suction-cup sole, which prevents slipping on a polished floor. The shoe protects the ankle and laces from the toe up. The sizes range from 5 to 11.

"WISCO" ATHLETIC SHOES.

The shoe shown here, intended for wear by basketball players, is made on the "Wisco Turnwell" principle, which affords great flexibility and extremely light weight for a shoe of its kind. The uppers are of the finest black calf. The notable feature is the soft and pliable fiber-

The indoor running shoe, also illustrated, has the best quality corrugated rubber tap sole, with light kangaroo horse uppers, cut under at the heel to secure a snug fit. The sizes run from 3 to 11. Both of these styles of athletic shoes are made by the same concern, and, like its other goods marked with the "Wisco" trademark, are guaranteed to give satisfaction and reasonable service when used for the purpose for which they are intended under the ordinary conditions and with fair treatment by the wearer. (Wisconsin Shoe Company, Milwaukee, Wisconsin.)

"WISCO" INDOOR TRACK SHOE.

THE "LOCKTITE" PATCHER.

Already a part of the standard equipment on a large number of cars, the "Locktite Auto-New-Matic" patcher seems to fill a long-felt need. Patching inner tubes by this method is claimed to be superior to ordinary ways of mending tubes on flat surfaces, as the tube is held and the edges of punctures, cuts, and blow-outs are prevented from curling under and wrinkling. An illustrated instruction sheet accompanies the device and gives simple directions. (Locktite Patch Co., Detroit, Michigan.)

"AUTO-NEW-MATIC" INNER TUBE PATCHER.

HICKORY GARTERS FOR CHILDREN.

The Hickory garter is made with a body of fine mercerized saten with straps across the front and back to hold it in place, while the garters themselves are attached to the belt at the bottom of the body part. The garters have a patented rubber cushion loop which saves wear on hosiery, and the webbing and elastic are of excellent quality. (A. Stein & Co., New York City and Chicago.)

"BROWNIE" SKOOTER.

SKOOTER ON RUBBER-CUSHIONED TRUCKS.

The "Brownie" skooter for children has a strong 20-inch footboard mounted on four ball-bearing skate wheels carried on rubber-cushioned trucks, and is guided by a 24-inch handle conveniently placed. The toy is painted bright red and comes packed by the dozen in corrugated fiber cases. Extra parts, including the rubber cushions for the trucks, may be ordered separately, as needed. (F. D. Kees Manufacturing Co., Inc., Beatrice, Nebraska.)

TROUSER SUPPORTER UTILIZES RUBBER.

The Faust trouser supporter, made from 26 to 44 inches long and from 4 to 8 inches wide, fastens with flat buttons and reinforced buttonholes, while rubber "finger" pads hold the shirt down. The belt strap is adjustable and there is an invisible leather money-pocket. The wide sizes are designed especially for stout men. (Faust Manufacturing Co., Chicago, Illinois.)

FAUST TROUSER SUPPORTER.

THE "INKOGRAPH."

An ink pencil with a one-year guaranty is an article sure to

AN INK-PENCIL WITH RUBBER PLUG.

interest the many who rely upon pencils and fountain pens. Its points of superiority are as follows: (1) three or four carbon copies may be made at once; (2) lines may be drawn with a ruler without blotting and blurring; (3) the smooth, hard, round gold point will not break or bend; (4) it can be carried in any position without danger of leakage; (5) it is ready for instant use the moment the cap is taken off.

The "Inkograph" is made in many different styles, for a wide range of prices. The latest model has a rubber plug inside the cap which prevents leaking while upside down. (Inkograph Co., Inc., 670 Sixth avenue, New York City.)

CARPET WASHER WITH RUBBER BRUSHES.

A new washer for rugs and carpets is shown in the accompanying illustration, which makes it no longer necessary to remove them from the floor in order to have them perfectly clean and sanitary. The "Hamilton Beach" carpet washer is a combination of washing machine and vacuum cleaner, equipped with two rubber brushes that oscillate 500 times a minute, duplicating the action of the human hand perfectly, it is claimed, only in a more thorough manner. No water touches the rug or carpet, however. Only the warm, sudsy cleaning compound is scrubbed down to the bottom of the nap in so thorough a manner that every thread is cleaned. The dirt is removed by the powerful suction,

HAMILTON BEACH CARPET WASHER.

simultaneously with all moisture. The soap compound intended to be used with this carpet washer is said to contain no harmful chemicals or animal fats, being based on a vegetable oil that leaves the carpet sweet-smelling and sanitary. (Hamilton Beach Carpet Washer Co., 114 Liberty street, New York.)

REPAIR TOOL FOR DIVERSE USES.

The Schrader "Universal Five-in-One" valve repair tool, it is claimed, performs three repair and two utility operations namely: (1) repairs the inside thread on valve and (2) the outside thread on valve stem for valve cap; (3) smooths down valve-cap washer seat on valve; (4) removes or inserts valve inside; (5) deflates tube by holding down valve inside, by screwing deflator into mouth of valve. These valve-repair tools are put up ten to a counter display board, with easel back for convenience in displaying. (A. Schrader's Son, Inc., 783 Atlantic avenue, Brooklyn, New York.)

SCHRAEDER VALVE TOOL.

THE "ALL-WEATHER" AUTOMOBILE TOP.

A handsome custom built automobile top for individual cars is called the "All-weather." The frame is of hard wood, reinforced with sheet steel, padded with felt. The side panels are of clear glass set solidly into hard-wood frames covered with material to match the waterproof topping. The glass is held in place by a leak-proof rubber compound. The side panels may be removed, frame and all, for summer driving. Curtains with celluloid windows are provided as a substitute, and these may be folded and carried under the seat of the automobile. The curtains also match the top material. (The All-weather Top & Body Co., Inc., 6345 Carnegie avenue, Cleveland, Ohio.)

"EASY-REST" CUSHION.

Carnegie avenue, Cleveland, Ohio.)

PRACTICAL AUTOMOBILE ACCESSORIES.

An excellent wedge-shaped back cushion, for use by women automobile drivers or persons of small stature, is made of heavy 32-ounce rubberized fabric with a black enamel finish. It is stuffed with a high-grade sea moss which does not pack hard or get lumpy, because tufts are sewed in nine places with black upholstering buttons, to help preserve the shape. The maker claims that the "Easy-Rest" cushion shown in the illustration above retains its resiliency indefinitely.

The same manufacturer is putting out the "Wear-Ever" leather reliners for tires, prepared on regular tire forms, shaped to fit the inside curve of the casing. They are coated on one side with a heavy tayer of rubber cement that is moistened with gasoline when applying the reliner to the tire casing.

Another specialty of this manufacturer is a rain guard to cover the crack between the hood cover and cowl on a Ford automobile. It is made of durable rubberized duck and prevents moisture running down to the

"STEEPLE" RAIN GUARD FOR FORDS.

wires. The back fastens under the wind shield with nickel-plated snaps and the front over the radiator top, while two straps hold the sides snugly. The guard is easily removed when not required for use. (A. J. Stephens Rubber Co., Kansas City, Missouri.)

THE EDITOR'S BOOK TABLE.

"EXPORTER'S GAZETTEER OF FOREIGN MARKETS." 1920-1921.

Compiled and edited by Lloyd R. M. Jones, editor of "The American Exporter," New York City. The volume is published by C. C. New York City. (Cloth, 6 by 9 inches, 766 pages.)

THIS book is prepared with the object of providing in readily accessible form facts about the world's markets which may be used for reference by the American business man concerned with foreign trade.

The countries of the world are listed alphabetically by continents; units of currency, measurement, capacity and weight are converted into units commonly understood by Americans; maps of the different countries are provided, along with information regarding area, population, commerce, production, industry, railroads, telegraphs, telephones, money, weights, measures, commercial language, principal shipping routes, customs tariff, consular regulations and representation, cable rates, mail time, postal rates, regulations with respect to parcel post, money orders and reply coupons, and other statistics. Supplementary tables and a complete index are given at the close of the book.

NEW TRADE PUBLICATIONS.

THE CAMERON MACHINE CO., 57-61 POPLAR STREET, BROOKLYN, New York, is issuing to its friends neatly framed illustrations of the various types of slitting and rewinding machines, made by this company for the rubber trade; and also views, both exterior and interior, of its well-equipped plant in Brooklyn.

PORTABLE MACHINERY CO., PASSAIC, NEW JERSEY, HAS JUST PUBLISHED a 24-page catalog entitled, "Portable Conveyors," complete with illustrations showing the various uses of the scoop conveyor and other portable conveyors manufactured by this company. The catalog describes clearly the labor, time and money saving features of the machines in storing, reclaiming, loading and unloading material, such as coal, coke, ashes, sand, gravel, crushed stone, fertilizer, cement, chemical, etc.

THE RUSSELL MANUFACTURING CO., MIDDLETOWN, CONNECTICUT, issues a neat booklet describing the "Rusco" products. Since its organization in 1830 by the great-grandfather of the present president, the company has grown from one mill to thirty-eight, with a floor space of 450,000 square feet. Some of the goods manufactured to-day are: brake linings, cone and disk clutch facings, fan belts, tire straps, anti-squeak webbing and hand lacings.

THE "TWENTIETH YEAR BOOK AND ANNUAL REPORTS," OF THE Rubber Association of America, Inc., is just off the press. It was prepared by the general manager and secretary, and contains a list of the officers and committees of the association proper, and of the various divisions.

A membership list is included, along with photographs and other matters of interest to the members of The Rubber Association.

THE NATIONAL INDIA RUBBER CO.'S NEW FACTORY JOURNAL, "Keds Live Wire," the name embracing the shoe and wire departments, made its initial appearance at Bristol, Rhode Island, on Saturday, June 26, and was a very creditable and breezy paper. It is to be issued weekly on Thursday for distribution among the employees of the concern. Frank Damosch, Jr., has been appointed editor; Francis J. McIsaac, sporting editor; John T. Ashton, photographer; Pietro Vaccaro, Italian translator, and Anthony Alfred, Portuguese translator. There will be a reporter for each room and the paper will include all items of interest in and about the factory.

"CURRENT DIFFICULTIES IN DOMESTIC DISTRIBUTION" WAS THE subject of an important address by W. O. Rutherford, general sales manager of The B. F. Goodrich Rubber Co., Akron, Ohio, before one of the group meetings at the annual convention of the Chamber of Commerce of the United States at Atlantic City, New Jersey. In it he discussed the condition of American business, with pertinent comment and constructive suggestions regarding transportation by rail and motor truck, factory production, labor conditions, finances, individual and industrial economics and the circle of rising costs. Although money is the controlling factor in the situation, he concludes that we are suffering more from mental than financial instability and that there is nothing seriously wrong with the country.

INTERESTING LETTERS FROM OUR READERS.
FROM AN AGED FATHER.

TO THE EDITOR.

DEAR SIR:

I want to locate the address of my son, Alfred Dunn, who I am told, is a superintendent of a rubber company about 45 miles from San Francisco, California.

If you can give me any information how I can locate him, I will be much obliged.

I. R. DUNN.

Aged Men's Home,
51 Belmont street,
Toronto, Canada.

A DEFENSE OF THE FILIPINOS.

TO THE EDITOR:

DEAR SIR:—Allow me to make some comments upon your editorial of last month entitled "A Setback to Filipino Progress."

While everybody is entitled to his own opinion, I do believe that it is not fair to state that the act of the Philippine Government in refusing to amend the laws that limit the extension of land that can be acquired by a company and that prohibiting the importation of Chinese laborers, is a crass folly; and it is the height of unfairness to say that this action shows the absolute incapacity of the Filipinos for self-government.

Similar laws are enforced in some states of the Union, among them California, and we doubt your readiness to brand these states as incapable for self-government. The Government of the United States is really responsible for the exclusion of Chinese laborers from the Philippine Islands. The laws limiting the extension of land that can be acquired by any corporation have been dictated by a wise sense of national protection and according to one of your own contributors, Lieutenant Colonel H. F. Cameron, of the Engineers Corps of the United States Army in an article published in the same issue where your editorial appears, "these laws were framed by an early American administration."

Furthermore, Colonel Cameron states that: "The Philippine Government has under serious consideration the necessary law changes to permit large responsible individuals to operate. Understanding the present situation as outlined above, it is believed that capital with faith and courage in the Philippine Government may take the maximum land area allowed by present laws and develop, using Filipino labor, with an assurance that amended laws will soon permit this operation to expand on as favorable a business basis as now pertains to the rubber-producing Dutch Netherlands and British Colonies of the Far East."

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(811.) A correspondent desires to know the best commercial method of finding the percentage of lead hydrates and lead carbonates in ordinary white lead.

(812.) A correspondent wishes to know address of owner of patent on or manufacturer of a machine for forming rubber balls, toys, etc., before they go into the molds.

(813.) A request is made for the addresses of manufacturers of brass fittings for rubber bath and basin stoppers.

(814.) The name and address of the manufacturer of the "Sorelle" rubber heel is desired.

(815.) A correspondent wishes to obtain the names and addresses of the concerns making machines for the manufacture of small hose.

(816.) Directions for making a dipping solution for toy balloons are desired.

(817.) The name of the manufacturer of the Daisy milk bottle stopper is requested.

(818.) A foreign correspondent wishes address of reputable manufacturer who will make reservoir sacks for self-filling fountain-pens strictly according to specifications.

(819.) Inquiry is made by a foreign correspondent for the names of any firms manufacturing a machine for rolling finger cots.

(33,277.) A surgical supply company in Canada wishes to purchase elastic webbing. Quotations f. o. b. shipping port. Cash payment.

(33,287.) A commercial agent in Italy wishes to secure representation of firm for sale of rubber goods. Correspondence may be in English.

(33,294.) A trading firm in Australia desires an agency for motor accessories. Quotations c. i. f. Australian port.

(33,297.) An import firm in Ceylon wishes to purchase motor cars and motor accessories. Quotations c. i. f. Ceylon.

(33,306.) A commercial agency firm in Brazil desires an agency for the sale of automobiles, supplies, and rubber goods. Quotations c. i. f. Brazilian ports and f. o. b. American ports. Correspondence may be in English.

A HAND-POWER STUMP PULLER

Clearing land for rubber planting involves the removal of stumps and therefore a stump puller that is already in use on rubber plantations in the Far East, will be of more than passing interest.

This hand-power puller, as its name indicates, is operated by hand with either one or two men, and its light weight makes it readily portable to any point where it may be

THE "K" POWER PULLER AT WORK.

needed. The simplicity of construction and operation is such that any one, even of the most ordinary intelligence, can use it with a few minutes' instruction. With a hundred pounds' pressure on the handle, the machine will develop a pull of 48 tons, which is more than two large tractors or one compound locomotive will develop. It can be carried into position by two men or wheeled about by one, and works equally well in the air or on the ground. (The Fitzpatrick Products Corporation, 99 John street, New York City.)

RESISTANCE OF RUBBER OBTAINED BY COAGULATION OF LATEX.

By coagulating latex with sulphuric acid in the presence of phenol it is possible to obtain sheets of raw rubber of surprising strength and elasticity, the breaking strength being 190 grams per square millimeter and the permanent set small. After heating for 20 minutes at 100 degrees C. the extensibility and permanent set are greater but the breaking strength is unaffected; heating for 4 hours at 110 degrees C., however, causes the rubber to become very weak and plastic. If strips of the rubber are vulcanized in the sulphur bath at 135 to 140 degrees C., a very elastic product is obtained with a breaking strength of 666 grams per square millimeter.—V. Henri, in "La Caoutchouc et la Gutta-Percha," 1920, 17, pages 10196-10202.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following district or cooperative offices. Requests for each address should be on a separate sheet, and state number.

(33,149.) A trading company in Argentina desires the exclusive agency for the sale of rubber belting. Quotations by mail or cable c. i. f. Argentine port.

(33,170.) A company in Norway wishes an agency for the sale of rubber and rubber goods. Quotations c. i. f. Norwegian port. Payment through banks in Norway and New York.

(33,211.) A manufacturer's agent in Australia desires an agency for the sale of all kinds of rubber goods, except tires.

(33,218.) A company in Danzig desires exclusive agency for motor cars and cycles, as well as tires. Quotations c. i. f. Danzig in United States currency. Correspondence in German.

(33,224.) A firm of engineers and merchants in Wales wishes agency for sale of motor tires and rubber goods. Quotations c. i. f. English ports.

(33,254.) A commercial agent in Bulgaria wishes agency for sale of fine quality raincoats. Quotations c. i. f. port of Varna. Correspondence in French.

(33,255.) A commercial representative from Colombia who is now in the United States wishes to secure an agency for sale in Colombia of rubber goods.

(33,261.) A merchant in Norway desires to purchase five tons of washed Pará rubber. Quotations c. i. f. Bergen.

Summer Outing of The Rubber Association of America.

GEDNEY FARMS HOTEL, WHITE PLAINS, NEW YORK.

FAIR WEATHER greeted the three hundred and fifty rubber men and their guests on Wednesday, July 28, at Gedney Farms Hotel, near White Plains, New York, where the Nineteenth Annual Summer Outing of The Rubber Association of America was held.

Easily accessible from New York City by train or motor, Gedney Farms, with its comfortable modern hotel, beautiful country surroundings, and every facility for sport and recreation, is an ideal spot for a summer outing.

The members and guests commenced to arrive by train or motor as early as 10 o'clock and soon the hotel lobby was filled with a jolly crowd of rubber men who had forgotten business in a day's outing where good fellowship reigned supreme.

Among the first on the grounds were the golfers, who took possession of the 19-hole golf course and the club house, situated on a shady knoll not far from the hotel proper, and providing every comfort and convenience of a first-class country club. With clear skies and a cool breeze, the ball was driven from the first tee promptly on time and the golf tournament was on.

The contestants in the tennis tournament were on hand early, also, and occupied the excellent courts adjacent to the hotel. With an entry field of some 25 in the singles and 8 teams in the doubles the day was hardly long enough for the elimination contests in singles and doubles and the playing of the prize-winning finish.

Impromptu contests were soon in progress in the bowling al-

leys where picked teams representing rubber manufacturers and importers contended for the satisfaction of beating the other fellows.

The knights of the cue took possession of the billiard room, where match games of billiards and pocket billiards afforded amusement for the devotees of these sports. The adviser-general was W. G. Kelly, of Poel & Kelly, credited with the invention of kelly pool.

During the heat of the day the swimming pool was well patronized by those aquatically inclined and in the afternoon a water polo match between picked teams afforded amusement for the players and interested spectators.

Between 1 and 2 p. m. an excellent luncheon was served in the hotel dining hall, accompanied by the latest music and popular songs, led by an efficient jazz band.

THE TENNIS TOURNAMENT.

In the inter-firm doubles, the plan of a team of players representing firm members was not followed and the players teamed up as they entered the courts. After the eliminations, the finals were played by the following teams: S. H. Johnson, of J. H. Lane & Co., and H. G. Smith, of the United States Rubber Co., vs. D. S. Kubie, of Raw Products Co., and H. P. Farrington, of Pennisular Trading Agency. The score was 6-3, 6-4, the former team winning the first prize, two gold-mounted leather pocket books, and the second prize, two silver-mounted belts, went to the latter team. E. H. Baker, of W. H. Bass & Co., won the ten-

MEMBERS AND GUESTS OF THE RUBBER ASSOCIATION AT THE SUMMER OUTING AT GEDNEY FARMS.

his singles from H. G. Smith, of the United States Tire Co., score 6-3, 6-4, whereby Mr. Baker won a leg on the perpetual challenge cup, donated by The Rubber Association, to be won

Gross 93, handicap 20, net 73. E. H. Sprague, of the Sprague Tire & Rubber Co., Omaha, Neb., won two thermos bottles with the second low net score of 80 gross, 10 handicap, 70 net.

THE BANQUET HALL.

three times, and a gold-mounted pocketbook. The second prize, a silver-buckled belt, went to Mr. Smith.

THE SWIMMING POOL.

In Class "B", A. D. L. won a leather golf-bag with the low gross score of 103. The first low net prize, a smoking set, went

AERVIEW OF GEDNEY FARMS.

THE GOLF TOURNAMENT.

The golf committee had arranged a handicap play golf tournament open only to members of the Association with prizes for the low gross, first low net, and second low net scores. The

to E. P. Gwillim; score 103 gross, 26 handicap, 77 net. H. Hardinburgh was the second low net man, scoring 103 gross, 23 handicap, 80 net, and won a dozen golf balls.

In the special contest for guests, a cocktail shaker, the prize

HOTEL LOBBY.

THE GOLF COURSE.

entries were divided into Class "A" and class "B", according to handicaps, two distinct contests for members being held.

In Class "A" the prize for the low gross score, a leather golf-bag, was won by G. G. Yule, of the Falls Rubber Co., Cuyahoga Falls, Ohio, with a score of 79. A mantel clock, the prize for the first low net score, was won by W. E. Kavanaugh, of the Plymouth Rubber Co., Canton, Mass., with the following score:

for the low net score was won by A. E. Betteridge, who scored 82 gross, 8 handicap, 74 net.

The putting was open to everyone and the first prize, a leather pocket cocktail case, went to E. A. Goddard, of the Sterling Tire Corporation, Rutherford, N. J. D. A. Paterson, of Balfour-Williamson & Co., and P. E. Young were tied for the second prize, a silk umbrella. Mr. Young won on the toss.

THE BASEBALL GAME.

An impromptu ball game was arranged between teams representing rubber manufacturers and rubber importers, umpired by

OVERLOOKING THE TENNIS COURTS.

H. W. Jenkins, of the New York Insulated Wire Co. The battery for the manufacturers was: Flint, pitcher, and Scranton, catcher. Utley and Millenthal pitched and Bouton caught for the importers. The score was 9 to 7 in favor of the manufacturers.

It was a tired and hungry, but happy, crowd that took places in the banquet hall for the final entertainment of the day. The menu was excellent, and the informal character of the dinner, accompanied by jazzy music and chorus singing, inspired a happy mood in everyone. The time for leaving came too soon and members and guests, after the usual friendly salutations, departed for home, while the orchestra played appropriate music in the Italian garden in front of the hotel.

The unqualified success of the outing was due to the efficient

THE HOTEL TEA GARDEN.

work of the outing committee: A. H. Brown, George A. Ludington and W. O. Neil; the sub-committee, A. H. Brown and R. L. Chipman for golf; and Roger S. Hardy and Harold French for tennis; and General Manager Viles and his competent assistants.

ACTIVITIES OF THE RUBBER ASSOCIATION OF AMERICA.

BULLETINS.

THE SUBJECTS relating to industrial relations covered by bulletins sent to members of the association last month include: "Wages and Output," "Two Successful Profit Sharing Plans," "Women Workers in Five Major Industries," "Incompetence the Leading Cause in Business Failures," "Wage Increases in the United States and in Great Britain," and "A Successful Small Hospital Plan."

WAGES AND OUTPUT.

It is frequently asserted that to increase wages is a sure way to secure increased output. That there is a point at which even

so strong an influence as a money incentive may not be able to overcome technical conditions in production—a point of diminishing returns beyond which increased wages do not result in proportional increased production—is usually not recognized. For this reason wage and output data obtained in the course of the National Industrial Conference Board's investigations of the hours of work problem are of interest. The Board found that increased wages did not, except in some cases, result in increased output, and that on the whole no definite relationship between wages and changes in output could be traced.

SMALL HOSPITAL PLAN.

That first aid hospital service is a success in a plant of three to four hundred employes, has been demonstrated by the Essex Rubber Co., of Trenton, New Jersey. The management states that, aside from the excellent medical assistance taken advantage of by the workers at the plant, the reduction in liability insurance premium for one year, as a result of installing this service, offset the cost of the equipment.

It is not the purpose to render any aid that should properly be subject to the attention of a physician, and it is necessary that this phase of the service should be in accordance with the State laws. An efficient nurse, and assistant, capable of administering first aid, keep closely in touch with the factory workers and report to the management each month—an example follows:

REPORT OF FIRST AID WORK FOR MONTH ENDED JUNE 30, 1920.

Four accident insurance cases during the month included in the above.

Of the 114 calls made during June, 87 were for the purpose of investigation, 22 were sick and accident calls, and five were to request applicants to report. The 87 home calls revealed the following reasons for absence: personal illness, 26; personal business, 11; illness at home, 5; working elsewhere, 19; unsatisfactory excuses, 17; nobody home, 9.

Four of the applicants asked to report had taken other positions and only one reported to the Employment Office.

HAGEMAYER & BRUNN, 82 BEAVER STREET, NEW YORK, AN OLD and respected firm of crude rubber importers, were not able to meet their contracts last month and voluntarily requested the appointment of the following investigating committee: Edward Maurer, Edward Maurer & Co., Inc., chairman; William E. Bryn, L. Littlejohn & Co., Inc.; A. H. Brown, Meyer & Brown, Inc.; C. R. Swaney, William J. Kelly, Poel & Kelly, and A. W. Stedman, Arthur W. Stedman, Inc., secretary of the committee.

News of the American Rubber Industry.

DIVIDENDS.

AMES-HOLDEN-MCCREARY, Limited, Montreal Quebec, Canada, declared its quarterly dividend of one and one-quarter per cent, payable July 2 on preferred stock of record June 21, 1920.

The Canadian-Connecticut Cotton Mills, Limited, New York City, and Sherbrooke, Quebec, Canada, has declared the following dividends: ten per cent on both A and B stock and an extra dividend of one-half of one per cent, all payable August 2 on stock of record July 15, 1920.

The Corn Products Refining Co., New York City, declared the regular quarterly dividend of \$1 a share on common stock, payable July 20, and one and three-quarters per cent on preferred, payable July 15, besides an extra dividend of one-half of one per cent, all on stock of record July 6, 1920.

The Firestone Tire & Rubber Co., Akron, Ohio, declared the following quarterly dividends: \$2 on common stock, payable June 20 on stock of record June 10, and one and one-half per cent on six per cent preferred stock, payable July 15 on stock of record July 1, 1920.

The General Tire & Rubber Co., Akron, Ohio, declared its quarterly dividend of one and three-quarters per cent on preferred stock of record June 20, payable July 1, 1920.

The Hood Rubber Co., Watertown, Massachusetts, has declared its quarterly dividend of one and three-quarters per cent, payable August 2 on preferred stock of record July 20, 1920.

The Kelly-Springfield Tire Co., New York City, has declared the following dividends: quarterly, \$2 per share, payable August 16 on eight per cent preferred stock of record August 2; quarterly, cash, \$1 per share, and quarterly, stock, three per cent, payable August 2 on common stock of record July 17, 1920.

The Manufactured Rubber Co., Philadelphia, Pennsylvania, declared its quarterly dividend of one and one-half per cent, payable July 7 on stock of record June 30, 1920.

The Meyer Rubber Co., Columbiana, Ohio, declared its quarterly dividend of two per cent, payable July 15 on outstanding preferred stock of record June 30, 1920.

The A. J. Stephens Rubber Co., Kansas City, Missouri, declared and paid its quarterly dividend on common stock July 1, 1920.

The Sterling Tire Corporation, Rutherford, New Jersey, has declared the following dividends: quarterly, one and three-quarters per cent outstanding seven per cent preferred stock; quarterly, two per cent on outstanding series B preferred stock; and one per cent on outstanding common stock—all payable July 20 on stock of record July 6, 1920.

The Tyler Rubber Co., Andover, Massachusetts, declared its regular quarterly dividend of \$1.50 per share, payable July 15, 1920, on common stock.

The United States Rubber Co., New York City, declared its regular quarterly dividends of \$2 per share, payable July 31 on both common and first preferred stock of record July 15, 1920.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, declared dividends of two per cent on both preferred and common stock, payable July 15 and July 31, respectively, on stock of record June 30, 1920.

FINANCIAL NOTES.

The United States Rubber Company has sold Kuhn, Loeb & Co. \$20,000,000 ten-year 7½ per cent notes, secured by \$25,000,000 of 6 per cent bonds, issued under the company's first and refunding mortgage of January 2, 1917. Owing to the present time being unfavorable for long-term bonds it was in the interest of

the company to borrow upon the bonds for a shorter period of time rather than to sell them under existing conditions. The bonds themselves run for thirty years from January 2, 1917. The proceeds, with the current surplus earnings, will give the company sufficient funds for the completion of the plant extensions now in progress at Detroit, Hartford, Providence and Indianapolis, for the increase of the company's tire production, which is far below the demand. The company does not contemplate any further financing and it is not expected that there will be another meeting of the board of directors before the middle of September.

Lee Rubber & Tire Corporation sales for the first six months of 1920 were approximately \$4,400,000 and net profits before taxes amounted to \$500,000. Estimated sales for the year are placed at \$8,500,000. Business is active, though June as usual was the low month of the year. Almost 50 per cent of Lee's sales are now of its puncture-proof cord tires.

Westinghouse Electric & Manufacturing Co. is again shipping orders at the annual rate of fully \$160,000,000. The transportation congestion has been entirely relieved, and orders are now being shipped without delay. Orders at the parent plant during first quarter of the fiscal year, which began April 1, were approximately \$41,000,000, against \$16,000,000 in first quarter of the last fiscal year. Annual rate of bookings is thus over \$160,000,000 for the parent plant alone, and for all plants is running well above \$180,000,000.

The remarkable growth of the automobile industry the last four years, especially since the close of the war, is reflected in expanding production and growing prosperity of rubber companies.

Total sales of rubber tires in the United States this year will exceed \$1,000,000,000. In 1916 they were less than \$500,000,000. In the current year approximately 40,000,000 tires will be produced, compared with 18,500,000 in 1916. In addition, millions of dollars' worth of rubber footwear, clothing and mechanical goods will be turned out.

The following tabulation from the Boston News Bureau, of four leading rubber companies, shows net profits after taxes per share on common, dividends paid on common, and net sales for 1916 and 1919 and estimates for 1920:

	Net Profits	Per Share on	Divs. Paid on	
U. S. Rubber	After Taxes	Common	Common	Net Sales
1920.....	\$23,000,000	\$22.00	a\$8.00	\$30,000,000
1919.....	17,730,257	17.50	a\$2.00	25,589,465
1916.....	16,842,195	15.12	12,759,129
Goodyear:				
1920.....	13,690,000	c\$2.00	b12.00	225,000,000
1919.....	12,277,245	98.58	12.00	178,914,082
1916.....	7,045,330	35.65	c12.00	63,950,000
Goodrich:				
1920.....	218,000,000	20.00	6.00	210,000,000
1919.....	17,304,813	25.19	4.00	141,343,419
1916.....	9,582,764	12.75	4.00	70,990,782
Kelly Springfield:				
1920.....	2,800,000	9.00	a\$4.00	4, ...
1919.....	2,422,822	9.82	b4.00	3, ...
1916.....	1,988,819	8.62	3.75	7, ...

*Estimated annual rate.
aStock dividend of 12½ per cent declared January.

bCommon dividends at \$8 annual rate resumed October, 1919.
cBefore federal taxes.

dOn basis of common capitalization after giving effect to 150 per cent stock dividend declared June, 1920.

eAlso 150 per cent stock dividend.

fAlso 100 per cent stock dividend.

gCurrent dividends are at annual rate of \$4 a share cash and 12 per cent stock.

hAlso 9 per cent stock dividend.

iNot available.

United States Rubber Co. is the largest producer of rubber footwear in the world. It ranks second in production of tires. Large demand for rubber footwear which will accrue this fall, when dealers replace stocks depleted by last winter's severe

weather, and the steadily increasing output of tires resulting from operation of new plants nearing completion, should bring sales this year close to \$300,000,000, a \$75,000,000 increase over last year and two and one-half times business in 1916. After almost four years of no dividends on the common, disbursements at annual rate of \$8 a share were resumed last October. As a further reward to junior shareholders a stock dividend of 12½ per cent was declared in January. It is not unlikely that another stock distribution will be made before the end of this year.

Goodyear Tire & Rubber Co. expects to earn \$30,000,000 before federal taxes this year. This would be equivalent to about \$42 a share on 618,930 shares of common which will be outstanding on conclusion of present financing and payment of 150 per cent stock dividend declared last month. The company has been paying common dividends at annual rate of \$12 a share in cash since 1900. In the same period 450 per cent in stock dividends has been distributed.

The B. F. Goodrich Co. will do a business this year approximately three times greater than in 1916 and net profits before federal taxes, estimated to reach \$18,000,000, will be almost double 1916 net of \$9,568,764. Although the company was obliged to do some financing recently, issuing \$30,000,000 five-year 7 per cent notes, the common was placed on a \$6 a share annual dividend basis in January, compared with previous rate of \$4 a share.

Kelly-Springfield Tire Co. has not shown an increase in earnings in the same proportion as the others, for the reason that its manufacturing capacity has not been expanded. It has under construction a new plant at Cumberland, Maryland, which will have a capacity greater than all its existing plants. The new factory will not be completed before end of this year, but Kelly-Springfield should show results of this development in 1921.

NEW INCORPORATIONS.

Aetna Tire & Rubber Co., June 30 (New York), \$300,000. O. C. Meyer, E. W. Hallam, F. Trautwein, Jr.—all of 387 Manhattan street, New York City.

Ames Holden Rubber Boot Co., Ltd., May 5 (Canada). Preferred stock, \$800,000. Common stock, \$2,000,000. T. H. Rider, president; directors: R. W. Ashcroft, D. L. McLaughlin, H. Wellen, W. B. Wiegand. Principal office, Montreal, Quebec, Canada. Factory, Kitchener, Ontario, Canada. To manufacture and deal in rubber boots and shoes and all other things of which rubber forms a part.

Anderson Tire & Rubber Co., July 12 (Delaware), \$7,000,000. L. Horthy, M. C. Kelly, S. T. Mackay—all of Wilmington, Delaware.

Argonaut Tire & Rubber Co., February 5 (California), \$3,500,000. R. Whitson, H. G. W. Dinkelspiel—both of Chronicle Building, San Francisco, California. Principal office, Oakland, California. To deal in auto tires and rubber goods for automobiles.

Cowart Non-Blow Out Tube Co., January 2 (Texas), \$150,000. M. A. Des, president; J. A. Cowart, vice-president; J. J. Simms, secretary. Principal office, Midlothian, Texas. To manufacture tube that does away with all pinches, punctures and will not blow out if protected from the ground with small holes, no matter how old the tube.

Eastern Rubber Reclaiming Co., July 1 (Massachusetts), \$30,000. H. E. Rooney, 24 Everett avenue; F. V. O'Neill, 166 Hamilton street; J. E. Marden, 43 Harvard street—all in Dorchester, Massachusetts. Principal office, Boston, Massachusetts. To conduct general rubber reclaiming and manufacturing business.

Eclipse Cord Tire Corp., June 16 (Delaware), \$1,000,000. L. E. E. Connett, White Plains; W. J. Cullen, New York City; C. M. McKee, Brooklyn—all in New York. To manufacture tires.

Eric Cord Tire Co., Inc., July 22 (New York), \$50,000. F. X. McFarland; J. J. Cosgrove, both of 72 West 93rd street; T. Lyons, 122 West 102nd street—all in New York City. To deal in tires and automobile accessories.

Gillette Tire Company of New Jersey, Inc., May 25 (New Jersey), \$25,000. F. F. Mitchell, 176 Peshine avenue; J. J. Keller, 46 North 17th street; U. G. Taylor, Jr., 163 Elizabeth avenue—all in Newark, New Jersey. Principal office, 164 North street, Newark, New Jersey. To deal in charge, T. Furst. To deal in tires.

Goody Rubber Co., Inc., June 28 (New York), \$50,000. H. F. Vortkamp, 240 Broadway; R. M. Williams, 286 West 127th street, both in New York City; J. B. Joselow, 4922 New Utrecht avenue, Brooklyn—all in New York. To manufacture rubber and gutta percha.

Hartigan, Inc., John D., July 22 (New York), \$5,000. J. D. Hartigan; E. J. Barnett; J. H. Kennedy—all of Greepport, New York. Principal office, Lunkport, New York. To deal in tires and automobile accessories.

Hydro-Speedway Tire Corp., July 9 (New York), \$25,000. W. Stahlich, president and treasurer; A. A. Barkard, vice-president; H. Seitz, secretary. Principal office, 146 East Genesee street, Buffalo, New York. To deal in automobile tires.

Lion Tire & Rubber Co., Ltd., The, February 17 (Canada), \$2,500,000. J. H. Greenberg, president; A. Tipling, vice-president; A. Campbell, secretary and treasurer. Principal office, 502 Kent Building, Toronto, Canada. To manufacture automobile tires, tubes and any other line of goods of which rubber forms a part.

Mason Rubber Plantations Co., The, April 5 (Ohio), \$6,500,000. O. M. Mason, president; J. H. Diehl, vice-president; R. W. Mackinnon, vice-president, treasurer. Principal office, 1000 W. A. Cluff, 114 Prespeet place—all of Brooklyn, New York. Principal office, Brooklyn, New York. To manufacture tires.

Mead Rubber Co., Inc., July 6 (New York), \$100,000. J. F. Mead, 244 Jefferson avenue; J. E. Hagan, 1308 Dean street; A. E. Hagan, 114 Prespeet place—all of Brooklyn, New York. Principal office, Brooklyn, New York. To manufacture tires.

Mechanical Rubber Manufacturing Co., Inc., May 19 (Massachusetts), \$200,000. F. J. Heustler, 6 Rindred avenue, Cambridge; M. C. Tobin, 43 Fenwood Road, Boston; J. S. Stone, Wayland—all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture, buy, sell, and deal in rubber articles.

Model Glue Mfg. Co., Inc., July 6 (New York), \$10,000. F. Auerhahn, 470 55th street; M. Spivack, 1213 41st street, both of Brooklyn; H. Sherman, 541 West 144th street, New York City both in New York. To manufacture glue, rubber cement, etc.

No-Air Auto Tire Co., Inc., July 8 (New York), \$100,000. I. Trautman, 1909 52nd street; G. A. Carlucci, 188 President street, C. P. Carlucci, 239 Union street—all of Brooklyn, New York. Principal office, Brooklyn, New York. To manufacture tires.

Nojar Rubber Co., June 15 (Massachusetts), \$100,000. T. Lithgow, 15 Gray street, Boston; A. E. Whittemore, 32 Winthrop Hall, Cambridge; V. G. Hopkins, 24 Hall avenue, Watertown—all in Massachusetts. Principal office, Boston, Massachusetts. To buy, sell and deal in any and all products made in whole or any part of rubber.

Poughkeepsie Tire Sales Co., July 16 (New York), \$30,000. Raymond O. Squire, Signor J. Severs, 29 Market street, Poughkeepsie; J. F. Snyder, 245 West 55th street, New York City—both in New York. Principal office, Poughkeepsie, New York.

Prize Tire & Rubber Co., June 10 (New York), \$7,500. H. Zaum, M. M. R. Form—all of 145 West 117th street, New York City. To make automobile tires.

Regent Tire & Rubber Co., Inc., June 28 (New York), \$20,000. H. O. Kahane, president and treasurer; J. M. Saunders, secretary; L. L. Jacobson, 229 Broadway, New York City. Principal office, 229 Broadway, New York City. To buy, sell, import, export and generally deal in tires and tubes.

Reliable Tire Service, Inc., June 24 (New York), \$10,000. G. L. Jones, 489 Washington avenue; V. L. Belting, 25 Ten Eyck avenue; E. A. Piersce, 618 Myrtle avenue—all of Albany, New York. Principal office, Albany, New York.

Sanitary Rubber Products Co., June 10 (Delaware), \$275,000. F. R. Hansel; J. V. Pimm; E. M. MacFarland—all of Philadelphia, Pennsylvania.

Service Rubber Co., The, March 5 (Ohio), \$25,000. V. W. Rothe, T. E. Wilson, R. C. Goode, H. O. Hoffman, F. B. Wilson. Principal office, 381 Windsor street, Cincinnati, Ohio. To manufacture dipped rubber goods, specializing in toy balloons.

Smith Tire Corp., Ray, June 21 (New York), \$500. R. L. Smith, Hollis, Long Island; E. A. London, 292 Sutter avenue, Brooklyn; D. Fried, 317 Stanton street, New York City—all in New York. To conduct tire business.

Standard Rubber Co., June 23 (Delaware), \$5,000,000. T. L. Croteau, M. A. Bruce, S. E. Dill—all of Wilmington, Delaware. To manufacture rubber articles.

Standard Rubbers Finance Co., June 23 (Delaware), \$250,000. T. L. Croteau, M. A. Bruce, S. E. Dill—all of Wilmington, Delaware. To deal in rubber securities.

Tire Service Corp., June 16 (Delaware), \$100,000. C. T. Cohee; G. Steigler; E. E. Aberle—all of Wilmington, Delaware. To do a wholesale and retail tire and automobile accessory business.

Valentine-Fitch Rubber Co., May 28 (California), \$100,000. W. D. Valentine, 229 Western Mutual Life Building, Los Angeles, California. Principal office, Los Angeles, California. To deal in all kinds of rubber goods.

Zion Tire & Rubber Co., Inc., H. C. July 6 (New York), \$100,000. R. Farma, 445 West 117th street; F. Fischer, 309 Broadway, both of New York City; H. C. Zaun, 107 Beebe avenue, Queens, both in New York. To manufacture tires.

SIXTH NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

Returning to New York City, the Sixth National Exposition of Chemical Industries will open in Grand Central Palace, September 20 and continue until September 25, inclusive.

The expansion in the chemical industry, as shown by the increased number of exhibitors, necessitates the use of four floors in the Palace, and applications for space are still being received almost daily, so great is the interest in the exposition. Total applications for space up to June 30, were 358, which is a new record. The exposition this year will be more pretentious than ever; in fact, it will be the largest distinctly industrial exposition ever held, and will surpass its own predecessors by one-third.

Two new sections will feature the exposition this year. These are the Fuel Section and the Materials Handling Section. Both are considered very important. The business side of the exposition will have many interesting features. These include sessions on subjects which will be developed in the two new sections of the exposition, and sessions on chemical engineering for which elaborate programs have been planned. Motion pictures which will have keen interest for technical men, will be part of the program and there will also be addresses for the education of the public.

A WIDELY KNOWN FACTORY MANAGER.

JOHNS KEARNS, manager of the Lee Tire & Rubber Co., Conshohocken, Pennsylvania, was born in Boston, Massachusetts, in the public schools of that city, graduating later from Comer's Commercial College. His first employment was with the Boston Car Spring Co. in 1879. In 1891 he joined the Overman Wheel Co., where he had charge of the rubber departments until 1898, when he went to the India Rubber Co., of Akron, Ohio.

JOHN KEARNS.

Three years later he went to Melbourne, Australia, to join the Dunlop Rubber Co. forces, where he remained until 1913, when he became associated with the Fisk Rubber Co., Chicopee Falls, Massachusetts. In 1916 he went to the Lee Tire & Rubber Co. and is at present its manager.

Mr. Kearns has had an exceptionally varied experience in the rubber business. He is almost as well known in England and the British Colonies as in America. In Ceylon he is interested in a rubber plantation and has many acquaintances throughout the Far East. He is a member of several fraternal orders and president of the Tuberculosis Relief Association of Springfield.

PERSONAL MENTION.

A post card from Raymond B. Price, one of the directors of the United States Rubber Company, dated Singapore, Straits Settlements, May 25, reports him visiting the Sumatra plantations of the company on the way to Japan.

Bushnell Bigelow, who for some time has been manager of eastern sales for The New Jersey Zinc Co., Inc., 116 Front street, New York City, now is assistant general sales manager for the company. Walter L. Hess takes Mr. Bigelow's place as manager of eastern sales.

Murray S. Bierer has entered the rubber brokerage business, with offices at 299 Broadway, New York City.

A. L. Viles, of The Rubber Association of America, has been honored by appointment upon the recently created New York Terminal Committee, to represent the shippers' interests. The other members are A. J. Miller, of the Delaware, Lackawanna & Western Railroad Co., representing the carriers; James Maybury, Jr., of the Public Utilities Commission of New Jersey, and Alfred M. Barrett, of the Public Service Commission, First District, New York.

The duties of the committee are somewhat similar to those of the terminal committees which served while the Government was operating the railroads. Their primary object is to bring about the greatest measure of cooperation among all the elements connected with the transportation situation.

Charles Muller, general manager of the Standard Emax Co., Chicago, Illinois, has severed his connection with the company and will engage in the mineral rubber business for himself. He has been identified with the company since its inception and is largely responsible for its success. During an experience of fourteen years he has studied the requirements of rubber manufacturers and has made many friends in the trade.

Edward J. Brown, formerly a salesman in the employ of the Acme Rubber Manufacturing Company, Trenton, New Jersey, and now connected with the Hood Tire & Rubber Company, of Pitts-

burgh, Pennsylvania, was recently married to Miss Mae St. Clergy, of Rockford, Illinois. The wedding took place at Erie, Pennsylvania.

Henry C. Pearson, Editor of THE INDIA RUBBER WORLD, New York City, has accepted an invitation to join the Honorary Advisory Council of the Fifth International Exhibition of Rubber, Other Tropical Products and Allied Industries and of the International Conference to be held in connection therewith in London in June, 1921, under the chairmanship of Dr. Joseph Torrey, A.M., Ph.D.

FACTORY MANAGER, SYRACUSE RUBBER CO.

WILLIAM E. GREER, factory manager and third vice-president of the Syracuse Rubber Co., Inc., Syracuse, New York, is a native of Akron, Ohio, where he was born April 24, 1884.

WILLIAM E. GREER.

He attended the grammar and high schools in that city and in 1898 entered the employ of The B. F. Goodrich Co., with which firm he remained until 1906, the first four years in the druggists' sundries department and the last four in the automobile tire department.

Going to the Firestone Tire & Rubber Co. for a year as inspector of automobile tire casings, he then took a position with The Miller Rubber Co., starting its automobile casing and inner tube departments and remaining in charge for ten years. In 1917 he went to the Mid-Continent Tire Manufacturing Co., Wichita, Kansas, as factory superintendent,

and on June 1, 1919, became factory manager and third vice-president of the Syracuse Rubber Co., Inc.

Mr. Greer's wide experience in some of the leading tire factories of the country and his specialized knowledge of cord tire construction will fit him for the task before him with this flourishing young company.

Mr. Greer is a Royal Arch Mason and a member of the Elks and Rotarians.

THE RUBBER TRADE IN THE EAST AND SOUTH.

By Our Regular Correspondent.

NEW YORK NOTES.

THE Electric Storage Battery Co. has removed its New York office from 100 Broadway, where it had been for the last twenty-two years, to the National Association building, 23-31 West Forty-third street.

The Hohmann, Nelson Co., Eau Claire, Wisconsin, manufacturer of a complete line of temperature, time and condensate controllers, recording and indicating thermometers, steam pressure regulators, etc., has opened an eastern sales office and sample room at 1599 Nostrand avenue, Brooklyn, New York, in charge of B. O. Pallin.

Mecke & Co., New York City, importers of crude rubber, etc., have admitted Nicholas Brunning, Orange, New Jersey, to the partnership whose other members are Hugo Volkening and Henry A. Ahrens.

The Hodgman Rubber Co., Tuckahoe, New York, is adding four additional stories to a one-story, reinforced concrete building already constructed, for the purpose of consolidating certain manufacturing operations.

The newly elected officers and directors of The Polack Tyre & Rubber Co., Broadway and 62d street, New York City, are as follows: Samuel Mundheim, chairman; Hugo Hoffstaedter, president; Reuben Mundheim, treasurer; Milton Dammann, secretary, and John F. Crowley, auditor.

The Powertown Tire Corporation, Rochester, New York, which was formerly The Rochester Tire & Rubber Co., has announced the following officers: Thomas J. Costello, president and general manager; Henry J. Crowder, vice-president; Dr. Ernest W. Ewell, treasurer; Arthur M. Johnson, secretary, and E. O. Benning, director.

The Niagara Rubber Manufacturing Co., 246 Herman street, Buffalo, New York, is a partnership of brothers organized for the pulling or reclaiming of fabric for manufacturers and to make blow-out patches, reliners, and skived patches. H. Heimerl is manager.

The Ajax Rubber Co., Inc., has found it necessary to move its Philadelphia branch office to larger premises, at 846 North Broad street.

CONNECTICUT NOTES.

The Kelley Tire & Rubber Co., Inc., New Haven, Connecticut, has increased its capital stock from one million to five million dollars. The company moved from its temporary headquarters into its new office building on July 14. The foundation and part of the first story of the main factory are well under way, indicating that the plant will be in operation late this fall, and making 500 cord tires and 2,500 inner tubes daily.

The New Haven Sherardizing Co. announces the removal of its main office from New Haven, Connecticut, to 868 Windsor street, Hartford, Connecticut. The factory was removed some time ago, as previously stated in our news columns.

SOUTHERN NOTES.

The Hopewell Insulation & Manufacturing Co., Inc., Hopewell, Virginia, which was incorporated in March, 1920, has installed extensive equipment for the manufacture of insulating compositions, insulators, and parts for electrical transmission, as well as for use with wireless apparatus. It expects to begin production at an early date and be able to build dies in addition to making molded insulation parts for electrical use. S. S. Sonneborn is president and general manager.

The Dixie Rubber Co., 768 Randolph building, Memphis, Tennessee, has practically completed the sale of its stock and authorized placing of contracts for its new factory, which it expects to have completed and in operation by January of next year. The factory equipment will cost approximately \$220,000 and the powerhouse equipment over \$100,000. The total cost of the plant and equipment is estimated at \$434,000. William J. Greene is factory manager.

The Cord Tire Corporation, Chester, West Virginia, maker of "Superior" cord tires, has raised its capitalization from \$500,000 to \$1,000,000, in order to take care of increased business. The officers are: J. D. Comstock, president; H. B. Woodbury, vice-president, and H. J. Powers, secretary-treasurer.

E. T. Dempsey has been appointed manager of the Baltimore branch of the Mason Tire & Rubber Co., Kent, Ohio.

"TRUCKPORTATION" IS PROPOSED AS A TERM TO REPLACE THE words "truck transportation," in the interests of ease in use, descriptive value, and headline adaptability.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON NOTES.

THE LUZERNE RUBBER COMPANY, Trenton, has purchased a large tract of land along Brunswick avenue, fronting on the East Trenton Railroad. Since it was bought for investment purposes the consideration was not given. The property has a frontage of 60 feet and a depth of 900 feet and contains about five acres of land. It is an excellent one for manufacturing purposes, with good railroad facilities.

The K. B. Rubber & Tire Co., 117 East Hanover street, Trenton, New Jersey, has been made the New Jersey distributor for Bergougnan tires and tubes.

Charles H. Semple, president of the Semple Rubber Co., Trenton, has been made a director of the Carteret Club, which organization will shortly erect a new club house at a cost of \$200,000.

Thomas Hydes, a crude rubber broker, has purchased a three-story factory building at 109 Chancery street, Trenton. Mr. Hydes has had his headquarters on East Hanover street for the past twenty years and will now have considerably more room in his new location.

Three of the Trenton rubber manufacturing companies have taken out permits for the erection of additions. The Woven Steel Hose & Rubber Co. has let a contract to John Carrigan for a one-story boiler house on Prospect street to cost \$2,000. The United & Globe Rubber Co. will erect a one-story cement block addition to cost \$1,500. The Home Rubber Co. will build a one-story frame building on Woolverton avenue to cost \$1,500.

The Thermoid Rubber Co. has awarded a contract to the American Metallurgical Corporation, Philadelphia, for the installation of electric oven equipment to take care of the production of a special processed product to be placed on the market by the Trenton concern. The installation involves a number of new principles, especially pertaining to solvent recovery and automatic control of heat temperatures. The ovens will be placed in the new addition now being erected.

John E. Thropp's Sons Co., Trenton, New Jersey, has a new foundry under construction, which will cost about \$80,000. The building will be 75 by 250 feet, and all necessary equipment has been purchased and is ready for installation.

MISCELLANEOUS NEW JERSEY NOTES.

The Duratex Co., Newark, New Jersey, expects to occupy the new addition to its plant by September 1. Ground for the new buildings was broken in December, 1919.

Announcement is made of the removal of the Bayonne, New Jersey, store of The Hudson Packing Co. to 67 East 21st street, Bayonne.

The Braender Rubber & Tire Co., Rutherford, New Jersey, has practically completed a one-story power house addition, which is expected to be in operation by the first of the year. The new building is 73 by 75 feet.

The Ford Tire Co., Erie, Pennsylvania, contemplates establishing a tire manufacturing plant at Burlington, New Jersey. William James Whitton and Harry Ralavich, of the Ford company, called upon the city officials of Burlington and said they wanted to erect a plant for the manufacture of reconstructed tires and new tires. They announced that about \$250,000 would be raised to start the factory and that the concern would eventually be capitalized at \$2,000,000.

The factory will be two stories high and will employ about 300 men. Messrs. Whitton and Ralavich are said to have purchased a tire factory at Erie and the machinery is now being made at Trenton. The company claims to have a new mold which cuts

down the time of making a tire. The Burlington officials agreed to donate a parcel of land to the new tire company.

The Manhattan Rubber Manufacturing Co., Passaic, New Jersey, has let to the Stone & Webster Company, Broadway, New York, the contract for the erection of its reinforced concrete brick and steel plant. The estimated cost is \$1,000,000.

The Eastern Tire & Equipment Co., with principal offices at 22-26 Union avenue, Rutherford, New Jersey, has filed a certificate of dissolution in the office of Secretary of State Martin at Trenton.

The Dural Rubber Corporation, Flemington, New Jersey, by arrangement with the Automatic Safety Tire Valve Corporation, 1765 Broadway, New York City, will include the "Whistler" tire valve as part of the regular equipment of all Dural tubes, adding only 35 cents to the cost of each tire. This tire valve was described on page 366 of THE INDIA RUBBER WORLD, March 1, 1920.

The Whitall Tatum Co., 46-48 Barclay street, New York, will soon have increased facilities at its druggists' sundries plant at Keyport, New Jersey. Ground for a three-story steel and concrete addition has already been broken, and the company hopes to occupy it by October first. The addition and equipment will cost about \$200,000. The steady increase in the sale of "dependable goods" has made the extension necessary, though in the face of almost prohibitive building conditions.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent

THE FEATURE of the business situation among the Rhode Island manufacturing rubber industries and their auxiliary and co-ordinate branches, during the past month, has been the vacation period, practically all the plants in the State having been closed one or two weeks. Advantage has been taken of this opportunity for an overhauling of power and machinery, renovations, alterations and improvements.

In accordance with a plan announced this spring, the Alice Mill of the Woonsocket Rubber Co., at Woonsocket, closed down for one week, beginning July 31 and opening August 9. This plan is not in accord with usual custom of one department shutting down after another, but all were shut down on the same day and all started up again on the same day.

The National India Rubber Co., at Bristol, shut down its entire plant on July 31, for a period of one week, to reopen August 9. This is to be a vacation with pay for all the employees of the factory who reported for work after the recent cessation without the necessity of recourse to the reemployment plan.

The following changes in the organization of the National India Rubber Co., Bristol, were recently announced, to become effective immediately: James W. Franklin, assistant to the vice-president; Edward I. Cooper, factory manager; Edward A. Currier, Jr., industrial relations manager; A. W. Anthony, manager of central stores. Mr. Franklin had been superintendent of the plant and Mr. Cooper, assistant superintendent. Mr. Currier had been an office executive and Mr. Anthony had been industrial relations manager.

A three-day conference of the truck tire experts of the United States Tire Co. was held July 12, 13 and 14. The conference opened with a session at the Hotel Astor, New York, July 12. A banquet in the evening was followed by a theatre party, after which the convention proceeded to Providence, where Harlow W. Waite, factory manager of the Revere Rubber Co.'s plant, Valley street, Providence, addressed the conference. He commented on the fact that the motor truck industry seemed to be on the verge of an expansion fully as great as that which came to the passenger car industry a decade ago, and that Providence, as the centre of the United States Tire Co.'s truck tire activities, was destined to have a large share of it.

The conference, which was attended by more than 100 truck tire experts in the employ of the United States Tire Co., representing every State in the country, assembled at the new truck tire manufacturing plant of the Revere Rubber Co., which has been named the Colt plant in honor of Colonel Samuel P. Colt. Tuesday and Wednesday were devoted to the conference on truck tire development, at the first session the subject being solid tires, with C. K. Whidden, of New York, manager of the solid tire department, presiding. On Wednesday, W. V. Logan, manager of the pneumatic truck tire department, was in charge of the discussion. An inspection of the new Colt plant, with its special equipment of the most modern solid-tire-making machinery, was a prominent feature of the conference programme.

One of the most interesting events of the convention was the presentation to George S. Shugart, vice-president and general sales manager, of a set of platinum and pearl studs and buttons.

The rubber bathing suits that are being made by the Revere Rubber Co. at its plant on Valley street, Providence, were given a picturesque introduction to the public the latter part of June when some half a hundred Providence children appeared in a pretty bathing beach scene at one of the theatres. While the particular costumes used in the scene were designed expressly for the act, they were manufactured in exactly the same manner as the regular goods. The costumes are cut from a roll of thin rubber sheet a yard wide and 50 yards in length. This is done on the upper floor of one of the several buildings which compose the plant. Here, more than 300 young women, working under ideal sanitary conditions, cut most of the patterns and trimmings. The machine assembling is done on this floor, but the finer work of assembling is done on a lower floor. The trimmings, such as birds, butterflies and other decorations, are cemented on the caps, and the goods are inspected for the second time before going to the vulcanizing room, after which they are inspected for the last time, and any defective ones thrown out. At the theatrical performance, where hundreds of persons learned for the first time of the existence of such garments, many expressed surprise at the bright coloring of the costumes.

On July 15 the figures of the State Board of Tax Commissioners of the State revenue from corporate excess, franchise, public service and bank share taxes were made public, together with a list of all individuals, firms and corporations having an excess of \$100,000 or more. Included in this list are the following, with the amount of their excess: American Electrical Works, Phillipsdale, \$2,652,932.44; American Multiple Fabric Co., \$124,296; American Wringer Co., New York, \$1,034,252.95; Anchor Webbing Co., Pawtucket, \$252,420.06; Arbeka Webbing Co., Pawtucket, \$163,438.99; Atlantic Tubing Co., Cranston, \$244,574.50; Bourn Rubber Co., \$276,700.29; Collyer Insulated Wire Co., Pawtucket, \$505,759.07; Davol Rubber Co., \$384,364.66; Everlastik, Inc., Boston, \$351,695.20; Federal Felting Co., Westerly, \$126,103.60; Glendale Elastic Fabric Co., Easthampton, Massachusetts, \$327,520.53; Goodby-Rankin Co., \$139,366.06; The B. F. Goodrich Rubber Co., Akron, Ohio, \$279,073.26; The Goodyear Tire & Rubber Co., Akron, Ohio, \$291,601.79; Hamilton Webbing Co., Hamilton, \$259,347; Hill & Lacross Co., \$257,534.65; Hope Webbing Co., Pawtucket, \$1,855,467.54; International Braid Co., \$1,409,400.80; Jenckes Spinning Co., Pawtucket, \$8,059,520; Mechanical Fabric Co., \$577,446.97; Mount Hope Spinning Co., Warren, \$465,791.81; National India Rubber Co., Bristol, \$2,213,025.04; O'Hannan Corporation, Boston, \$1,394,939.87; Phillips Wire Co., Pawtucket, \$2,159,288.83; Revere Rubber Co., \$524,114.01; Tamarack Co., Pawtucket, \$529,541.80; Tubular Veneer Fabric Co., Pawtucket, \$243,921.90; United Lace & Braid Co., Auburn, \$512,951.51; United States Rubber Co., New York, \$2,105,000.29; Washburn Wire Co., Phillipsdale, \$1,375,956.45; Woonsocket Rubber Co., Woonsocket, \$607,025.83. The enormous increase of \$3,994,861.70 over the tax of 1919 is shown in the assessment of the Jenckes Spinning Co., which has a corporate excess of \$8,959,920.

A contract has been awarded to the Flynt Building & Construction Co., of Palmer, Massachusetts, for the erection of a three-story addition, 95 by 42 feet, to the storage house of the American Wringer Co.'s plant in Woonsocket, and work thereon will be commenced shortly. One floor of the addition is to be used for the manufacture of boxes and crates, and machinery for this purpose will be installed. The remaining two floors of the new building are to be devoted to storage purposes.

Frederick E. Luth, for the past 15 years in the employ of the Glendale Elastic Fabric Co., Providence, during several years of which time he was foreman in one of the departments, died June 27 in his 47th year. He was born at Newport, Rhode Island, and is survived by his widow, four sons, a sister and two brothers.

Clyde O. Dudley, for the past four years traffic manager at the National India Rubber Co.'s plant, Bristol, has resigned to accept the position of traffic manager of the Woonsocket Chamber of Commerce and assumed his new duties July 12. He is succeeded by J. D. Cruickshank of the purchasing department.

FIRST GOODRICH SALESMAN IN NEW ENGLAND.

ELLSWORTH E. LEACH, Boston manager of mechanical and sundry sales for The B. F. Goodrich Rubber Co., was born at North Easton, Massachusetts, in 1862. Upon completing his

ELLSWORTH E. LEACH.

course in the Stoughton High School in 1878 he began his career in the rubber trade as errand boy for the American Rubber Co., Boston. During most of the twelve years he remained with this concern he was engaged in sales, first as a traveling salesman of general rubber lines in New York State and Canada. In 1884 Robert D. Evans, president of the company, appointed him associate manager to open the first New York office of the company as assistant to Eben H. Paine, who was later sales manager of the United States Rubber Co., Mr. Evans being the second vice-president of the latter company following Joseph Bani-

gan. Mr. Leach's sales work covered footwear and clothing from New York west to Chicago and south to the Ohio River, including Philadelphia, Baltimore and Washington.

In 1890 Mr. Leach opened in Boston the largest wholesale and retail rubber store in New England, known as the Metropolitan Rubber Co. From 1894 to 1899 he was engaged in the manufacture of rubber clothing and mackintoshes under the firm name of E. E. Leach & Co., Boston.

In the latter year Mr. Leach became the first traveling salesman for The B. F. Goodrich Co. in the New England territory. In 1902 the Goodrich company opened a small office carrying a small stock of specialty and mechanical goods in addition to tires, and Mr. Leach was made manager of both the mechanical and specialty departments. The company moved into a larger store on Columbus avenue in 1905, and five years later to the present six-story building on Boylston street. Mr. Leach did all of the traveling sales work from 1899 to 1910. Since then the New England traveling force has grown to seven men with Mr. Leach still on the job.

On May 1, 1920, Mr. Leach rounded out twenty years of loyal and faithful service and the sales force and department managers of the company remembered the anniversary by giving a dinner in his honor and presenting him with twenty \$20-gold-pieces,

one piece for each year of service. Mr. Leach has a very wide acquaintance and many friends in the rubber goods trade and he has played an important part in guiding the destinies of the Goodrich company in this part of the United States. He is a member of the Boston Athletic Association, Bay State Automobile Club, G. A. R. Associates and has been for many years a trustee of the Universalist church of Stoughton.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

"TRUCKPORTATION"—new terminology for freight hauling by pneumatically equipped motor trucks—has been given tremendous impetus in Boston and adjacent territory by the establishment of fifteen motor truck routes by The Goodyear Tire & Rubber Co. to give speedy and regular deliveries to service stations in the vicinity of Boston.

More than 68 per cent of all distribution from the local branch is being made by motor trucks, approximately 400,000 pounds of rubber products being transported each month. It is planned to deliver eventually by truckportation 95 per cent of sales made by the Boston office. Over 350 service stations are served by the fifteen truck routes. The company plans similar lines for those of its 74 branches in the United States affected by railroad transportation tie-ups.

The longest route running from the Boston branch is a two-day "Cape Cod" trip of 250 miles from Boston to Orleans, made weekly with stops at Plymouth, Sagamore, Brewster, Chatham, Woods Hole, Buzzards Bay and Wareham. The trip serves 40 distributors. The shortest line is the 50-mile run to Brockton, requiring less than eight hours and serving 12 distributors.

The 110-mile trip to Worcester is made tri-weekly in less than a working day to serve 33 service stations. Other routes run to Lowell, Weirs, Portsmouth, New Hampshire; Marlboro, Fitchburg, Athol, Rutland, Milbury, Haverhill and Gloucester, with many intermediate stops. Keene, New Hampshire is the terminus of a 168-mile route that will be established shortly.

BOSTON NOTES.

The O'Bannon Corporation, 30 State street, Boston, has had the honor of being recently cited by the War Department for meritorious service in the War.

The Central Automobile Tire Co., 111 Staniford street, Boston, is now a direct factory distributor for the Sterling Tire Corporation, Rutherford, New Jersey.

Lehigh tires are now available to New England motorists, a branch of the parent firm known as the Lehigh New England Tire Co. having been opened at 559 Columbus avenue, Boston. Fred W. Doherty is manager and will be assisted in developing business in this territory by Paul H. Bradley, eastern sales representative.

The Croker Pen Co., 36 Bromfield street, Boston, has awarded a contract for a one-story addition to its plant at Everett, Massachusetts, 60 by 120 feet, to cost \$45,000 to \$50,000.

L. J. Waldron, for the last five years assistant manager of the Boston branch of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, has been promoted to the position of manager of the New England territory of the same company, with headquarters at Boston.

H. H. Greenwood, a pioneer in the automotive industry, and for the past five years general sales manager for the Hood Tire Co., Boston, is New England distributor for Syra-Cord tires, with offices and salesrooms at 739 Boylston street, Boston. Mr. Greenwood's firm, the Syra-Cord Tire Sales Co., has established twenty agencies throughout New England.

MISCELLANEOUS MASSACHUSETTS NOTES.

The first of a series of Harvard University summer school visits to industrial plants in this vicinity was made July 13, when G. F. Miller conducted fifty students through the plant of the Hood Rubber Co. at Watertown.

One of the best features of the service work of the Hood Rubber Co., Watertown, is the nursing of employes who are ill. Rain or shine, a corps of efficient nurses makes a daily round visiting the homes of Hood operatives who are out because of sickness. Each nurse has her Ford coupé for better comfort and in order to make the most of her time. In working conditions, medical and dental attention, and care in sickness the company is doing everything possible to build up a body of stable working men and women.

The Tyrian Service Association of the Tyer Rubber Co., Andover, Massachusetts, has recently approved a set of badges which will be awarded to those completing one, ten,

HOOD NURSES STARTING THEIR DAILY ROUNDS.

fifteen, twenty, twenty-five and thirty-five years of service. Several employes, including the general manager, will receive the thirty-five year badge.

For the last few months, groceries have been supplied to the employes through a cooperative buying plan. The cost of goods has thus been reduced, and a supply of sugar for the canning season secured. An athletic committee has lately been appointed, and a baseball team organized.

The recreation department of The Fisk Rubber Co., Chicopee Falls, has long been a potent factor in building up a contented, efficient working force, and this season its activities take on new interest through the addition of new buildings and facilities at Fisk Park, including a new restaurant and handball court. The park night season of Friday evening entertainments was ushered in July 16, when the park was officially opened for the year. There were the usual Red Tops' baseball game, handball, tennis, quoits, trap shooting, special track events, motion pictures, fireworks and dancing with music by the Fisk jazz orchestra. The restaurant makes it possible for Fiskers to go direct to the park after working hours, get a good meal and make the most of the long summer evenings afforded by daylight saving.

Friday afternoons there are special festivities for the mothers and children of Fisk families, and this year the playground section of the park has more new equipment for the kiddies, such as swings and slides. Admission is by identification card obtainable free of the recreation department.

The Metropolitan Air Goods Co., Athol, Massachusetts, a subsidiary of the Athol Manufacturing Co. of the same place, is building a new two-story plant, 50 by 140 feet, to be equipped with modern machinery for the manufacture of hospital rubber goods. The original company was formed in Boston in 1891 and

survived under difficulties until 1913, when it was taken over by R. A. Whall, now its manager and treasurer, and incorporated as one department of the Athol Manufacturing Co. Outdoor pneumatic rubber goods are its specialties, but it also makes mattresses and cushions for hospital and domestic use. L. S. Starret is president of the company.

THE RUBBER TRADE IN THE MID-WEST.

(By Our Regular Correspondent)

MID-WEST RUBBER MANUFACTURERS' ASSOCIATION.

THE MONTHLY MEETING of the Mid-West Rubber Manufacturers' Association, held July 13, at the Chicago Athletic Club, was largely attended. Much interest was shown by the members present in the business of the Association that continues to expand as the membership increases. At this meeting the following new regular members were elected: The Automobile Owners Tire Corporation, St. Paul, Minnesota; The Giant Tire & Rubber Co., Findlay, Ohio; Rotary Tire & Rubber Co., Zanesville, Ohio; The Sponge Tire & Rubber Co., St. Paul, Minnesota. The associate members elected were The Utility Manufacturing Co., Cudahy, Wisconsin, and The Towar Textile Mills Corporation, Toledo, Ohio.

The first annual outing and summer meeting will be held at the Hotel Breakers, Cedar Point, near Sandusky, Ohio, on Monday and Tuesday, August 16 and 17, 1920. The price of tickets has been fixed at \$10.

As this is the first general rubber trade outing ever held in the Middle West, where so large a number of the rubber manufacturing plants are located, it has been decided to make the invitation general to everyone in the trade whether members of this association or not.

Cedar Point is an ideal spot for a summer's outing. There are commodious modern hotels, shady groves, amusement parks, a fine bathing beach, and a trip to historic Put-in-Bay, the scene of Commodore Perry's victory, is an added attraction.

It is but a fifteen-minute boat trip from Sandusky to Cedar Point, and boats run on regular schedule from Cleveland and Toledo. The Cleveland boat leaves at 8:30 a. m., arrives at Cedar Point 11:45 a. m. The Toledo boat leaves at 8:15 a. m. and arrives at Cedar Point 1:15 p. m.

The outing committee is as follows: H. S. Vorhis, chairman; E. T. Meyer, F. R. Henderson & Co., Chicago; Paul A. Bloom, Fred Stern & Co., Chicago; C. H. Tavenier, Charles E. Wood, Chicago; G. Matthias, Jr., Mineral Point Zinc Co., Chicago.

MISCELLANEOUS MID-WESTERN NOTES.

H. G. Olivier, formerly associated with the Goodrich and Diamond rubber companies at Pittsburgh, Pennsylvania, and well known in the automobile tire trade through his fifteen years of selling experience, has been appointed manager of the Indianapolis branch of the McGraw Tire & Rubber Co.

H. G. OLIVIER.

The Altenburg Tire Equipment Co., Davenport, Iowa, has purchased six and one-half acres of ground at West Davenport, on the Rock Island railroad, and the new foundry and machine shops now being erected on that site will be ready for occupancy by September 1. The goods manufactured will include complete tire repair equipment and molds, cores and machinery used in the manufacture of new tires. The capital stock of the company has been increased from \$125,000 to \$150,000.

The Surety Tire & Rubber Co., St. Louis, Missouri, is one of the new companies that are prospering. Two small buildings

have just been completed, and a third one is being started. For over a year the company has been manufacturing inner tubes, and now has begun to make cord and fabric tires of high quality.

The Hannibal Rubber Co., Hannibal, Missouri, has completed its factory buildings at a cost of \$150,000, and as soon as the equipment is installed it will start operations. Both cord and fabric tires will be manufactured under the name "Mark Twain." The inner tube is to be called "Indian Joe," after a Mark Twain character who still lives in Hannibal at the age of 92. Hannibal, it will be recalled, was the early home of the author. The officers of the company are: William J. Richards, president; H. M. Still, vice president; A. E. Gibson, secretary, and S. O. Osterhout, treasurer. Mr. Gibson will also serve as general sales manager and advertising manager.

Mason Scudder, a son of the founder and principal stockholder of the Rawlings Manufacturing Co., St. Louis, Missouri, has been elected vice-president of the company. The company manufactures game-balls of various kinds, including the "Ruko" which was described in THE INDIA RUBBER WORLD April 1, 1919.

L. N. Burns, who recently became associated with the Racine Auto Tire Co., Racine, Wisconsin, has been made head of the Horse Shoe Rubber Co. of Missouri, the distributing organization for Horse Shoe tires in Kansas and Missouri.

L. N. BURNS.

Mr. Burns, until January 15, was vice-president and general sales manager of the J. I. Case Plow Works Co., of Racine. The Horse Shoe Rubber Co. of Missouri succeeds the Lindman-Funk Co., distributors, who introduced the "Horse Shoe" tire line in the two states. Offices are already established in Kansas City and St. Louis. Mr. Burns will be directly in charge of all sales in the two states. W. E. McClurg will be vice-president of the new organization and will be in charge of the St. Louis office.

Jacob Warner Culver, who has been promoted to the position of central district manager of the Federal Rubber Co., at Chicago, Illinois, is a native of that State. Born in Galesburg and a graduate of the high school, business college and Knox College there, he first worked in the local postoffice for four years. In 1899 he went to Chicago as a stenographer for the Ayer & Lord Tire Co. For five years he was an accountant for railroad contractors, and for ten years he was a salesman and district manager for the Boston Woven Hose & Rubber Co. Prior to his promotion he had for some time been manager of the Federal company's mechanical rubber goods department.

Mr. Culver is a member of the South Shore Country Club and various tire and rubber trade associations.

A. Daigger & Co., Chicago, Illinois, dealers in rubber ingredients, have inaugurated a free rubber manufacturers' service as an adjunct to their laboratory research department. At its head is an expert chemist and rubber man who is prepared to take up without charge or obligation any problems and technical difficulties pertaining to chemicals, colors and oils submitted by the trade. A market letter including technical notes will be issued from time to time.

The Brunswick-Balke-Collender Co., 623-633 South Wabash avenue, Chicago, Illinois, is making extensive additions to its plant at Muskegon, Michigan. One new group includes four separate buildings in which the cord fabric is impregnated. These buildings have been completed and the machinery installed, at the

cost of \$1,000,000, so they will soon be ready for occupancy. The company has recently increased its capital stock from \$12,000,000 to \$50,000,000.

The Athol Manufacturing Co., Athol, Massachusetts, is erecting at Marysville, Michigan, a new plant consisting of main building, store house and churn room, giving about 34,250 square feet of floor space. The most modern ideas of factory building and machine layout are utilized. A hundred men are to be employed. By the middle of August it is hoped that the company will begin the production of a high-class rubber-coated fabric, for use in the manufacture of automobile tops.

The India Tire & Rubber Co., Akron, Ohio, has placed its southern Wisconsin territory under the supervision of Calvin F. Troupe, former branch manager for the Fisk Tire & Rubber Co., with headquarters in Milwaukee, where he will work in direct connection with The Ramler Rubber Co., India distributor in that city.

Work has been begun on the new factory of The Wilson Rubber Co., Des Moines, Iowa, and the accessory factory is already in operation, manufacturing the Wilson "SlaPatch." This company was incorporated December 16, 1918, capitalized at \$2,000,000, but active organization work did not begin until the spring of 1919. The executive offices are at 402-403 Hubbell Building, Des Moines, and the plant on the outskirts of the city, at West 63d street, River to River Road, and the Chicago, Milwaukee & St. Paul Railway. The officers are: W. E. Wilson, president and general manager; S. S. Wilson, vice-president; W. G. Richardson, secretary and treasurer. R. A. Torrey is mechanical engineer, and H. E. BeSaw is superintendent.

Some of the leading commercial artists of the country have prepared for the Standard Four Tire Co., Keokuk, Iowa, a series of twenty-six paintings portraying Indian lore and legend, to be used in an advertising campaign. The Indian Chief, Keokuk, who is said never to have broken a promise, once lived in the same locality, and the company has chosen his spirit and character to typify its own policy and aims. Consequently, Indian subjects were chosen for these paintings and the company has been to considerable expense for research work preliminary to their production, in order that they should be accurate in detail as well as characteristic portrayals of Indian life. They are said to compare favorably with the famous Remington paintings of Indians.

The Essenkay Products Co., Chicago, Illinois, has acquired 14 acres of ground at 83d street and Wentworth avenue, on which it will build a plant for the manufacture of its tire filler and rubber substitute known as "Essenkay." The first building, to be of concrete and steel, will be erected at an estimated cost of \$300,000. F. D. Mayer is president.

The Hoosier Rubber Co., Mishawaka, Indiana, which manufactures "Service" rubber heels, is a partnership consisting of Ted Nicar and N. V. Robertson. Mr. Nicar was formerly with the Firestone Tire & Rubber Co., Akron, Ohio.

The Synthetic Rubber Products Co., Fort Branch, Indiana, has been making plans for extracting rubber from cactus and expects to have the first plant in operation August first.

"FLEXIDE" FOR MEN'S BELTS.

A material adapted for use as a substitute for leather is called "Flexyde" and is made of rubberized fabric pebbled on one side to imitate the grain of seal leather. It comes in either black or cordovan, but any special grain, color, or thickness can be made on special order. The standard size is 1/32-inch in thickness, in sheets 36 by 36 inches. One of the recent adaptations of this material is for use in the manufacture of men's belts, which are, of course, washable and therefore eminently practical and entirely sanitary. (The Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio.)

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

AKRON NOTES.

ONE OF THE LARGEST BUILDING EXPANSIONS in the rubber industry at present is that of The B. F. Goodrich Rubber Co. at Akron. New construction is in progress which will increase the size of the plant twenty per cent and cost, with the new equipment and machinery, in excess of ten million dollars.

The new buildings will provide 779,000 square feet additional floor space, making a total of 4,554,304 square feet devoted to the manufacture of tires, hose, boots and shoes, and other rubber goods. Several thousand additional workers will be required next year to turn out the increased production planned.

The largest of the new buildings under construction is an eight-story warehouse for raw materials with 530,000 square feet of floor space. When completed it will be the largest factory building in the city. The second largest building will have nearly 200,000 square feet and will be used exclusively for tire building.

Other new buildings being erected include a giant water softening plant, an electric current transformer station, a large refrigeration building, and an extension to the boiler house of Mill 2. In spite of annoying delays in securing materials the work is going rapidly ahead, day and night, and it is expected that the program will be nearly completed before winter.

This new construction emphasizes the steady growth of the Goodrich company since it was organized fifty years ago, many years before any other rubber factory was opened in the "Rubber City." The original plant of the Goodrich company was a building 40 by 100 feet and only 35 employees were on the first pay-roll. To-day this original building could be tucked away and lost in any one of a dozen of the company's buildings. The force of 35

employees has grown to an army of 28,000 men and women.

An opportunity for employees of The B. F. Goodrich Rubber Co. to become holders of the company's common stock and to share in its profits is afforded by an employee stock subscription plan recently approved by the company's executive committee.

The stock will be sold to the employees for \$65 a share on weekly payments of 25 cents, each employee being allowed to buy one share for each \$300 of his annual earnings. Stock will be

sold in this way only to employees who have been with the company for three months or longer.

In the working out of the company's plan, stock purchased by the employee can be paid for at the end of three years and 24 weeks, even though the payments during this period will total only \$44.98 per share. Accumulated stock dividends and service credits will make up the difference between this amount and the stock purchase price plus interest.

Every time the company pays a dividend on its common stock it will credit a like amount toward the payment of each share of stock on which employees are making payment. At the present dividend rate, such dividends will amount to \$21 per share during the payment period.

The employee will receive through the service credit plan an additional credit of \$6 on the payment of each share purchased. This service plan provides \$1 credit on each share a year from date of first payment, \$2 at the end of the second year, and \$3 at the end of the third year. The service credits will be given even after the stock is paid for. At the end of the fourth year, \$4 cash will be given on each share held and at the end of the fifth year, \$5 cash. This will reduce the net amount cash paid for the stock of \$35.98 per share.

The Akron Gear & Engineering Co., operating a machine shop at the corner of South and High streets, Akron, is contemplating building a large modern machine shop on its property con-

Extensions to building 1

THIS NEW BUILDING EXPANSION PROVIDES 779,000 SQUARE FEET OF ADDITIONAL FLOOR SPACE, MAKING A TOTAL OF 4,554,304 SQUARE FEET DEVOTED TO THE MANUFACTURE OF GOODRICH PRODUCTS

sisting of four and one-half acres of land on East Market street, with frontage near Martha avenue. The company manufactures all kinds of gears as well as rubber machinery, cores, and molds. Contracts for the new structure will be let at an early date. The officers of the company are: J. Asa Palmer, president; W. F. Warden, vice-president; W. J. Frank, secretary and assistant treasurer; Otis E. Prier, treasurer and assistant secretary; T. A. Seacrist, general manager; J. R. Triplett, sales manager; William A. Brubaker, superintendent and mechanical engineer. The above, in addition to N. C. Stone, president of the National City Bank, Akron, comprise the board of directors.

During the past month the men on the Akron city street-car lines struck for increased wages and the rubber companies, in order to bring their operatives to work, were compelled to organize one of the greatest truck transportation systems ever devised in the city. Sufficient warning of the coming of the strike was given and the whole emergency system of transportation was completed and officially announced in factory publications at least one week before the men actually went out.

Another opportunity was presented by the coming of the strike to show the importance the automobile and the truck holds in the business world of to-day. Reports from the various factories indicate production was affected little, if any.

Ralph Upson, C. R. Johnson and C. M. McCreery, all in the aeronautical department of The Goodyear Tire & Rubber Co., and their wives, set a new record when they took their Fourth of July picnic dinner in a free balloon several thousand feet in the air.

More than 600 factory foremen were guests of H. S. Firestone, president of the Firestone Tire & Rubber Co., at an outing given on Mr. Firestone's farm the latter part of June. It required a line of automobiles more than a mile and one-half long to transport the men to the farm. The day was spent in sports of various kinds, followed by a country dinner. The outing this year was the seventh given the foremen by Mr. Firestone.

John Gammett, of the experimental department of The B. F. Goodrich Co. has been named a member of the newly created State Aviation Commission.

F. W. Work, brother of B. G. Work, president of The B. F. Goodrich Co., was grand marshal of an Independence Day parade in Akron, Monday, July 5. Approximately 8,000 persons were in line.

Plans for an aviation exhibition to be given by the Akron

Flying Club in the fall are being discussed. The plans provide for a more elaborate show than was held at Wright Field here recently.

H. C. Berry, of the Berry Airship Co., of California, has spent some time in Akron superintending the building of a dirigible by The Goodyear Tire & Rubber Co. for himself. The new machine will embody several features patented by Mr. Berry which will increase the speed of dirigibles.

Daily flights to Cleveland were made by airships from Akron during the aviation show held in that city July 2-7. The

FIRESTONE WINS INDUSTRIAL TRACK CHAMPIONSHIP AT PITTSBURGH, PENNSYLVANIA.

THE RUNNING BROAD JUMP, IN WHICH PITTLINGER TOOK FIRST AND MILLER THIRD.

"pony" blimp, the only one-man dirigible on the market, was among the ships which made the flight.

A total of 4,200 men and women enrolled in the Americanization classes conducted this year in Akron under the auspices of the Board of Education. E. C. Vermillion, formerly in charge of the Firestone Americanization work, is director. A total of 136 classes was served by 105 teachers. Classes were held in basements of churches, homes, factories and in rooming houses. The outlook for next year is still brighter.

The Industrial Salvage Co., organized by George W. Sherman, formerly in charge of the salvage department of The B. F. Goodrich Co., is upon a paying basis and will be able to declare a small dividend this year. The company has dealt largely with salvaged boilers and machinery during the past year. The war left a large amount of machinery in factories which is now useless in its present location and the company has been busy buying it up and shipping it to other locations where it is needed. The plan to make a house-to-house collection of salvage was postponed because of the amount of business coming to the company.

The Miller Rubber Co., Akron, increased its sales 63½ per cent during the six months ended July 1, 1920. From 1915 to 1919, the company's sales have increased 1,300 per cent. The business of the present year, it is estimated, will total \$50,000,000.

The India Tire & Rubber Co., Akron, has made the following appointments: J. E. McGinnes, formerly branch manager for the Firestone Tire & Rubber Co. in Milwaukee and manager of

IN ORDER TO SAVE TIME AND TO COMMENCE PRODUCTION AT THE EARLIEST POSSIBLE DATE IS HIS NEW PLANT AN ENTERPRISE, RUBBER MANUFACTURER IN THE AKRON DISTRICT INSTALLED THE CALENDAR BEFORE THE BUILDING WAS ERECTED

tire sales for The General Tire & Rubber Co., Akron, has been placed in charge of sales promotion work and K. C. Burischer, well known in railroad circles, has been appointed traffic manager. He was formerly connected with the Wheeling and Lake Erie railroad and with the traffic department of The Good-year Tire & Rubber Co., Akron.

The Supreme Cord Tire & Rubber Co., Akron, Ohio, with an authorized capital of \$2,000,000, is erecting a new plant on Home avenue. The main factory building is 60 by 300 feet, of brick and steel, and a power plant, 40 by 50 feet, is of the same construction. The officers and directors of the company are:

R. C. Witwer, president; A. G. Kaufmann, vice-president; Charles O. Patier, secretary-treasurer. The other members of the board of directors are: L. C. Koplun, William J. Kaufmann, Hon. Thomas H. Moore, S. W. Sweet, P. E. Welton, J. L. Swartz, B. L. Eaton, and W. B. Campbell.

MISCELLANEOUS OHIO NOTES.

Jay Chamberlin has been appointed manager of the Cleveland branch of the Pennsylvania Rubber Co., Jeannette, Pennsylvania. For the last two years he has represented the company in the Chicago territory.

The Pharis Tire & Rubber Co., Newark, Ohio, is erecting a 100 by 120-foot, three-story brick and steel addition and a new power house, and adding 100 per cent to the machinery equipment for the purpose of increasing production to 1,000 tires and 1,000 tubes daily. This company was one of the first to build 30 by 3½ clincher cord tires, and the growing business, principally with large jobbers, requires additional factory facilities. By November the company expects to be building all sizes of cord tires. The officers are: A. R. Lindorf, president; C. H. Otto Meyer, vice-president; Charles O. C. Lindrooth, secretary; R. S. Wyeth, treasurer; Carl Pharis, general manager.

The Hercules Rubber Corporation, with main offices at 908 Union Central Building, Cincinnati, Ohio, has purchased 35 acres of land on which it will erect a modern factory and power plant for the production of its special airless inner tube.

The Columbus Tire & Rubber Co., Columbus, Ohio, is installing machinery for the purpose of manufacturing fabric tires, in addition to its equipment for the manufacture of cord tires. It expects to produce fabric tires about August 1, 1920.

The Kee-Spears Rubber Co., Clinton, Ohio, which was incorporated November 3, 1919, to manufacture a general line of molded and mechanical rubber goods and hard rubber goods, including interior doors, door and window casings, room moldings, etc., has purchased a factory and is nearly ready to begin manufacturing. An additional building will be built at an early date, which will double the capacity of the plant. The officers of the company are: George A. Griffiths, president and general manager; W. W. Spears, vice-president; Culley B. Hall, secretary; A. J. Kee, treasurer; directors—Dempsey Lowe and Benjamin Blackmore.

Charles H. Wheeler has been elected a director of The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio.

C. D. Rockwood, purchasing agent of the Mason Tire & Rubber Co., Kent, Ohio, has returned from the Far East, which he visited in the interest of the Mason Rubber Plantations Co. He found conditions there very promising. J. P. Matthews, former purchasing agent of the company, remains at Singapore as far eastern representative.

The Premier Rubber & Insulation Co., Dayton, Ohio, has increased its capitalization from \$150,000 to \$250,000, owing to the great increase in business. The plant is now running night and day, in order to meet the heavy demands for hard rubber and bakelite products. The newly-elected officers of the company are: William Grether, president and treasurer; William F. Grieser, vice-president; John H. Shively, secretary.

The above-named, with Joseph Westendorf and Harry H. Gerstnor, comprise the board of directors. Henry Spatz has been appointed factory manager.

The National Rubber & Specialties Co., Chickering avenue and C. H. & D. Railway, Cincinnati, Ohio, manufacture a line of cements for bicycle, motorcycle, and automobile tires, as well as braziers, vulcanizers, enameling ovens, etc., for tire repair work.

The population of Kent, the home of The Mason Tire & Rubber Co., has been announced by the census bureau as 7,070. In 1910 the village had a population of 4,488. The increase was 57.5.

Ohio C. Barber, match king, capitalist and agriculturist who died in January, left an estate of more than \$5,000,000, it was shown, when his will was offered for probate recently. Some of the buildings on the Anna Dean farm, containing 1,000 acres, are being converted into dormitories and manufacturing build-

NEW BUILDING FOR THE PHARIS TIRE & RUBBER CO.

ings. The Babcox-Wilcox Co. of Barberton has leased one of the buildings for dormitories for additional men.

GENERAL HILLS, A NEW AKRON SUBURB.

An unusual scheme to beat the high cost of homes and at the same time solve the housing problem has been put in effect by the General Tire & Rubber Co., Akron, Ohio. The employees of the company, by adopting a plan of W. O'Neil, general manager, took over a 243-acre tract of land on the Massillon road about 1½ miles from the General plant and formed a development syndicate with Mr. O'Neil as trustee. This is believed to be the first time that the employees themselves have got behind a home-building project and undertaken its financing and development.

One thousand homes will be constructed to cost \$5,000 to \$6,700 and compare identically with property which has been bringing \$9,000 or more. Quite a sum of money is being saved by finding various men in the factory who have had experience in lumbering, road building and construction work, and these men were put in charge of the work with which they were familiar, thus eliminating contractors.

When completed the section will be known as General Hills.

It lies about 500 feet from Springfield lake, overlooking the lake and the valley. All conveniences, such as electricity, sewer, pavements and sidewalks, will be provided. Plans call for the formation of a community waterworks. A business center has been laid out and buses will operate from the community every 30 minutes.

In working out the General Hills plan, enabling the men to finance the enterprise, a double purpose has been accomplished, because while overcoming the financial handicap in home building, the men at the same time have been given something to take the place of unwise investments in the numerous wildcat stocks and other promotions which have been sweeping the country and which have contributed to the unrest of good workmen.

A DESIGNER OF RUBBER MACHINERY.

CURT KUENTZEL, experimental engineer with The B. F. Goodrich Co., Akron, Ohio, was born in Erfurt, Germany, in 1880. After studying at the Technical High School in Charlottenburg and the universities of Jena and Berlin, he graduated in 1903.

CURT KUENTZEL.

His first position was with Siemens & Halske Gummiwerke in Berlin, and he was later with the Gummiwerke Oberspree of the General Electric Co., in Berlin, Gummi & Kabelwerke, Dr. Cassirer & Co., in Charlottenburg, and Siedendeutsche Gummiwerke, in Mannheim.

In 1909 he came to America as assistant superintendent in the insulated wire department of the Diamond Rubber Co., Akron, Ohio. His training and inclination tended toward development work rather than management, and since that time he has held the positions of experimental engineer with the Good-

year Tire & Rubber Co., Akron, Ohio, and the Republic Rubber Co., Youngstown, Ohio, and is at present engaged in that capacity with The B. F. Goodrich Co.

In 1917 he planned and installed the Neumaticos Nacional, a rubber factory in Barcelona, Spain, of which he is now temporary manager. After a stay of a few months this year he will return to The B. F. Goodrich Co.

The patent records furnish eloquent testimony to Mr. Kuentzel's initiative and activity. He is the inventor of numerous rubber manufacturing machines, devices and processes, especially in the tire building branch of the industry.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent.

LOS ANGELES NOTES.

THE SAMSON TIRE & RUBBER CO., 333 Pico street, Los Angeles, has just shipped a cargo of tires and tubes to San Salvador, Peru, and New Zealand, and is planning a considerable extension of its export trade.

The Pacific Rubber Co., coast distributor of Horseshoe tires, has moved into its new general offices at 415 East 8th street, Los Angeles, a commodious, two-story, up-to-date building. According to Roy R. Meads, president and general manager of the company, the San Francisco branch has within a few months increased its sales several hundred per cent.

The "Wingfoot Clan" is the title of a bright, new weekly shop paper which made its debut at the Los Angeles Goodyear plant in July. It is in charge of F. H. Fuller, manager of the personnel department of the Los Angeles factory.

The Keaton Tire & Rubber Co., maker of the Keaton non-skid tire, has established a branch salesoffice in a new two-story building of its own at 1337-1339 South Flower street, Los Angeles. Alan T. Tarbell is in charge.

The first tires or tubes to be shipped east from Los Angeles have been sent out by the George W. Eno Rubber Co., of 1026 South Los Angeles street, Los Angeles, which recently forwarded 3,600 inner tires, as the endless liners made by the company are called, to Milwaukee. The same concern is preparing to ship a carload of the liners to New York at an early date, and will begin the manufacture of tubes in August.

M. C. Hale, president of the United States Compression Inner Tube Co., Tulsa, Oklahoma, announced on July 9 that his company had finally decided to establish its West Coast factory in Burbank, a suburb of Los Angeles, California, and had bought a site of 12½ acres there. Work on the factory will be started at an early date. A pneumatic tube, said to be practically punctureless, is the company's chief product. At the company's main plant in Oklahoma 2,000 tubes and 200 tires are turned out daily. C. R. Privett has charge of sales. The company's Los Angeles office is at 411 Citizens' Bank Building, and it also maintains a sales branch in Pittsburgh, Pennsylvania.

R. M. Merriman will be technical superintendent of the new factory of the Fabri-Cord Tire Co. about to be erected at San Pedro. Mr. Merriman held a similar position with The B. F. Goodrich Co. for twelve years. At present he is in Akron, Ohio, buying machinery, etc., for the new plant. He holds many valuable patent rights on tires, tubes, and machinery.

Of much interest to local rubber manufacturers who are anxious to get materials cheaply and quickly from the East, was the recent arrival at Los Angeles of the *Artigas*, the first vessel to be sent here from Philadelphia, via the Panama Canal, by the North Atlantic & Western Steamship Co. The voyage was made in 18 days and 18 hours. Three other vessels will soon be placed in service.

James H. Christian, president of the Fabri-Cord Tire Co., the latest rubber manufacturing enterprise in Los Angeles, California, was the first president of the Perfection Tire & Rubber Co., of Fort Madison, Iowa; and patented the well-known asbestos breaker strip. Having disposed of his interests, he took up cotton growing in Arizona, later formed the San Gabriel Reservoir Co. in Southern California, and finally the Fabri-Cord Co. Mr. Christian was born in 1866 at Mt. Carroll, Illinois, and has been in the real estate and building business in Detroit and Chicago.

JAMES H. CHRISTIAN.

The Kelly-Springfield Tire Co., the Goodyear Tire & Rubber Co., the Firestone Tire & Rubber Co., The B. F. Goodrich Rubber Co., and the United States Rubber Co. helped to finance a

recent ship-by-track run of 636 miles between Los Angeles and Imperial Valley, in the demonstration of the value of motor freighting under adverse conditions.

A direct shipment of 600 tons of crude rubber valued at \$750,000, from the Goodyear plantation in Sumatra, arrived in Los Angeles last month by the Los Angeles-Pacific Steamship Co.'s freighter, the *West Hika*, and is the first to come to the

PLANTATION RUBBER CARGO ARRIVES AT LOS ANGELES.

local Goodyear plant through the Los Angeles harbor. The illustration shows C. H. Kelly, W. J. Yarnell, Goodyear crude rubber department, C. W. Case, traffic manager, and the first sling of rubber to be unloaded. It is said that the Goodyear plant will use 18,000 tons of rubber annually when running to capacity.

It is stated at the Goodyear works that, while 2,000 are now employed, the company has applications from 7,000 for positions in the new plant. Eastern rubber workers are accordingly advised to hold their jobs and not to migrate to Southern California for a while at least.

J. O. Ward, manager of the Los Angeles branch of the Miller Rubber Co. of California, at 1233 S. Hope street, Los Angeles, is making a trip through the East and will spend some time at the Miller factory in Akron.

The California ad Arizona sales of Midco tires, manufactured by the Mid-Continent Tire Co., of Wichita, Kansas, will be handled by Bradford-Fuller, Inc., Figueroa and Eighth streets, Los Angeles.

SAN FRANCISCO NOTES.

B. M. Schreckengost, general factory representative of the Globe Rubber Co., of New York, who recently made an inspection tour on the Coast, reports that his business shows a healthy increase.

The Luthy Electric Storage Battery Co. has moved into its new building on Geary street, near Larkin, San Francisco. J. P. Schiller is in charge.

The Federal Rubber Co. of Illinois, Cudahy, Wisconsin, is erecting a new five-story warehouse and office building at Second South Park and Taber Place, San Francisco, according to E. L. Rettig, Pacific Coast manager for the Federal company. A large stock of tires will be kept here for Coast and export trade. The building, which will be completed this fall, will have approximately 70,000 square feet of floor space, and will cost about \$125,000. One of its features will be a special track extending through the building which will greatly facilitate the handling of incoming freight.

Good headway with its new building plans is reported by the Coast Tire & Rubber Co., of Oakland. A building is being erected on East 12th street, between 48th and 50th avenues, and machinery and general equipment have just arrived from the

East. The company has been having its cord and fabric tires made in Akron, but after September 1 it expects to do all its own manufacturing.

The exclusive agency for Owen cord, fabric, and solid tires for Northern California and Nevada has been acquired by the Owen Pacific Tire & Rubber Co., of 135 Hyde street, San Francisco, for which Harry A. Parker is sales manager.

George E. Machen and J. Dickson Smith have formed the Machen-Smith Tire Co., 1240 Van Ness avenue, San Francisco, specializing in half-sole tire work.

L. M. Simpson, for two years manager of the clothing and footwear department of the Los Angeles branch of the United States Rubber Co., has been transferred to Sacramento, where he will have entire charge of the U. S. R. Co.'s branch in that city. Mr. Simpson is a graduate of the University of Illinois, and very popular with his Los Angeles associates.

The Kelly Tire Service Co. has moved its headquarters from San Francisco to Stockton.

SOUTHWESTERN NOTES.

That success has followed the introduction of the bonus and premium plan of compensating workmen is the report of the Spreckels "Savage" Tire Corporation, San Diego. The system provides a premium for workmen making a required number of points contingent upon the work to be done, which must meet a certain standard. On the other hand, a penalty is imposed on workers for manifest carelessness. A decided improvement in the quality and quantity of the output and a better morale are said to be the outstanding results.

As many as 25,000 toy balloons are being made daily by the Pacific Balloon Co., of Riverside, a branch of the Howe-Bowman Balloon Co., Newark, New Jersey. Chain stores are among the largest buyers of the goods. Harold A. Dodge is the manager of the factory.

The entire town of Marinette, Arizona, fourteen miles northwest of Phoenix, and 7,800 acres of adjacent land have been bought by the Southwest Cotton Co., a subsidiary of the Goodyear Tire & Rubber Co. This territory now brings the total amount of land owned by the company and to be used for raising long staple cotton for tire fabrics up to 36,000 acres. This does not include 20,000 acres that have also been leased by the company for the same purpose, but which are held for future needs. The company is planning to erect dwellings on the newly-acquired land similar to those provided for the 2,000 employees who work on the company's plantations at Litchfield and Goodyear in the Salt River Valley.

Of the 30,000 acres planted to cotton in the San Joaquin Valley, California, most of it has been devoted this year to the raising of the Pima long-staple cotton needed for automobile tires. A government crop expert reports the cotton there as further advanced than in any other part of the Southwest. In experimental patches last year the Pima cotton in the valley averaged 520 pounds to the acre, but allowing 500 pounds to the acre for 1920 and with the cotton selling at \$1.50 a pound, a return of \$750 on each acre can be counted upon. The Mexican boll-weevil has done considerable damage to short-staple cotton in Texas and other Southern states, but so far the long-staple cotton crop in the Southwest has escaped injury.

NORTHWESTERN NOTES.

According to C. H. Boyer, western district manager for the General Tire & Rubber Co., of Akron, Spokane, Washington, is being considered as a probable site for a Pacific Coast branch factory.

R. S. De Orell, formerly with the Hartford, Knight, and Lee tire concerns, has been appointed superintendent of the Washington Tire & Rubber Co., which started in Spokane two years ago, and is now turning out 75 Western States tires a day.

The Western Rubber Co., Tacoma, Washington, has begun operations in its new plant. Tires are being manufactured in limited quantities only and chiefly for testing purposes, but the plant and equipment are equal to a capacity of 1,000 tires and 1,000 tubes a day.

The Tri-State Tire Co., distributor of Perfection tires, has leased a new building being erected at the corner of 10th and Stark streets, Portland, Oregon. A few stores in the building, which is 108 by 120 feet, will be subleased to accessory dealers, but the remainder will be occupied by the Tri-State Tire Co. A service station will be maintained, with a repair shop in the rear, reached by a driveway from the street.

Barry Wilson, formerly with the United States Rubber Co., and well known in the trade in San Joaquin and Sacramento Valleys, has taken charge of Firestone's Nevada tire business, with office at Reno, Nevada.

TIRE REPAIRING ON THE PACIFIC COAST.

Coincident with the rapid development of the automobile trade on the Pacific Coast, and influenced in no small degree by the rising cost of tires, has come about a notable growth in the tire-repairing industry. A year ago there were scarcely 400 vulcanizing shops on the Pacific coast, but to-day there are close to 600, over one-half the number being in California.

PIONEER PNEUMATIC-TIRED TRUCK.

A Packard truck equipped with Goodyear cord pneumatic tires has established the world's record for motor trucks in a coast to coast run from Los Angeles, California, to New York City. The total distance of 3,451 miles was covered in a total elapsed time of 13 days, 13 hours and 15 minutes. The actual running

GOODYEAR TRANSCONTINENTAL TRUCK AND MEN WHO DROVE IT FROM NEW YORK TO LOS ANGELES. INSERT, LEFT TO RIGHT, HOWARD SCHULDER, HERBERT TEMPLE.

time was 8 days, 12 hours and 55 minutes, and the average speed was 15.8 miles. Not a single tire change was made on the trip, which demonstrates the practicability and advantages of pneumatic tires in truck transportation.

As direct evidence that pneumatic tires prolong the life of a truck, the history of this one is interesting. Built in 1918, it has been in continuous service a little more than two years and has traveled approximately 120,000 miles. It has a three-ton chassis with a five-ton motor and carries a big enclosed body in which is a sleeping bunk, as well as room for a consignment of freight.

Its initial service was on the Akron to Boston express route, carrying Goodyear products to eastern points and bringing back fabric from mills, round trip 1,500 miles, time 5½ days. In 1918 and 1919 it was part of the motorcycle carrying boy scouts on long tours through the eastern states. In the autumn of 1918 it made the first transcontinental trip from Boston to San Francisco and return carrying a consignment of airplane tires, round trip, 7,763 miles. Its second transcontinental trip was made in

July, 1919, with the army motor convoy to San Francisco over the Lincoln Highway and return, carrying the Goodyear band which furnished music for the soldiers in convoy.

CANADIAN NOTES.

The Premier Tire & Rubber Co., Limited, Hamilton, Ontario, has been incorporated, under the laws of Ontario, with letters patent granted January 10, 1920. A factory building, one story in height, 50 by 150 feet, is going up rapidly at Beamsville, Ontario, probably to cost \$27,000. The company hopes to be turning out tubes at the rate of 400 to 1,000 a day by January, 1921. The officers are: Heber Tremaine Pyke, president, and William S. Attwood, vice-president. Estelle Margaret Pyke is a director, in addition to the above-named, and Messrs. Barr & McBride have been appointed auditors.

F. M. Morgan has returned to the Ames-Holden-McCreedy System, Regina, Canada, as manager of the Saskatchewan division, with headquarters at Regina.

Following the return of J. Westren, general manager of the Dunlop Tire & Rubber Goods Co., Toronto, Ontario, Limited, from England and the Continent, W. B. Northam, general sales manager of the Dunlop company, has sailed for England to be gone two months.

The building operations and the installation of the machinery in the new cord tire plant of the Dunlop Tire & Rubber Goods Co., Limited, at Toronto, are nearly completed and manufacturing will probably begin early in August.

The Dunlop Tire & Rubber Goods Co., Limited, Toronto, Canada, has inaugurated an employees' insurance plan as an evidence of their interest in the welfare of their employees and their goodwill toward them. More than 2,000 people are insured for amounts ranging from \$500 to \$2,500 according to length of service. The policy increases as the term of service lengthens, and the premiums are paid by the company, the employee being under no obligation. However, in the event of an employee becoming totally and permanently disabled before the age of sixty he or she receives the proceeds of the policy.

In 1919, Canadian automobile factories manufactured 94,000 motor vehicles and sold more than \$100,000,000 worth. There were 325,000 automobiles registered in the Dominion, compared with about 90,000 in 1915. The demand for motor trucks is increasing.

TARIFF NOTES.

Modifications of existing tariffs have been made in several European countries: Belgium, from June 21 on, adds to the tariff duties for rubber tires a "coefficient of increase of 2." Poland until further notice suspends the duties on rubber packing. Portugal imposes an export tax, from June 5 on, of 10 per cent ad valorem on wares of rubber, gutta percha, balata and similar products in any condition. A license to export is required.

THE ALL AMERICA CABLES CO. HAS OPENED A NEW CABLE service connecting Rio de Janeiro and Santos with the United States, and the rate from New York to Brazil has been reduced from 85 to 65 cents. The new cable system embraces over 22,500 miles of cables and land lines, and has recently entered Bolivia. Cables from Colon to points on the north coast of Colombia are now being laid, and soon a triplicate cable from Ecuador to Peru will be in operation.

S. YAMADA, WELL KNOWN IN THE JAPANESE RUBBER TRADE and formerly director of the "Gomu-Sekai" (Rubber World), has been appointed editor-in-chief of the "Gomu Jiho" (Rubber Times), the monthly journal of the Tokio Rubber Association.

THE OBITUARY RECORD.

PRESIDENT OF THE PENNSYLVANIA RUBBER CO.

HARRY WILFRED DUPUY, president of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, died July 4 at the French Hospital, New York City, where he had been taken following a stroke of apoplexy eleven days previously while on a visit to New York. He was only thirty-nine years old. For the past year he had been in poor health and had planned to sail for a trip to Switzerland with his family on July tenth.

HARRY W. DUPUY.

Born at Pittsburgh in 1880, Mr. DuPuy was educated in the high school at Pottstown, Pennsylvania, and in 1903 was graduated from Yale University with the degree of B. A. The following year he started in business with the Pennsylvania Rubber Co., first in the testing department, then advancing to assistant treasurer, later treasurer, and finally to president and treasurer in 1912.

Before the United States entered the war, Mr. DuPuy trained at Plattsburg, New York, for his commission, and entered the service in 1917. The arduous nature of the training which he again underwent, both at Plattsburg and Fort Niagara, it is said, left its permanent imprint upon him, and was indirectly the cause of his illness. He was a member of The Rubber Association of America, Society of Automotive Engineers, Association of National Advertisers, Aero Club of America and Motor and Accessory Manufacturers.

Mr. DuPuy is survived by his father, Herbert DuPuy, chairman of the Pennsylvania company's board of directors, and by his widow and son, all of whom live in Pittsburgh, where the family is active both in a social and business way. His brother, Charles M. DuPuy, is vice-president of the Pennsylvania company.

A PROMINENT SHOE TRADE JOURNALIST.

Frederic Farley Cutler, who was prominent in shoe trade journalism, died July 16, 1920, at his home in Newton Centre, Massachusetts. Since last December illness had prevented his being active in business. He was in his fifty-fifth year.

Mr. Cutler was born in Boston in January, 1866, and graduated from the Boston Latin School in 1885, but, after taking the entrance examinations for Harvard University, decided to enter business and took a position with the leather firm of Proctor, Hunt & Haskell. Five years later he entered the field of trade journalism and became manager of the Shoe and Leather Reporter Company, and in 1901 became president and treasurer of this company, afterward becoming the owner. In 1898 he established "The Shoe Retailer," and was also owner of that publication.

Mr. Cutler held membership in The Country Club, the Bræburn Country Club, Algonquin Club, Boston Athletic Association and in several other clubs in Newton, also in Hyannis, where he had a summer home, and at Pinchurst, North Carolina. He was also a member of the Masonic fraternity.

A PROMINENT GERMAN RUBBER MAN.

The last copy of the "Gummi-Zeitung" to hand contains the news of the death at the age of 68 years of Commercial Councilor Friedrich Bayer, second chairman of the board of the Farbenfabriken Friedrich Bayer & Co., in Leverkusen, near Cologne, and son of the founder of the enterprise.

UNITED STATES IMPORTS AND EXPORTS—NEW CLASSIFICATION.

Tables showing the imports into and the domestic exports from the United States in the calendar year 1919, stated in the terminology of the classification adopted by the International Statistical Congress, are issued by the Division of Statistics of the Bureau of Domestic and Foreign Commerce.

Quantities are shown in United States denominations and values in dollars and in "Pan Americanos," a proposed international money of account equal to one-fifth of a dollar. The import values represent the wholesale price of the merchandise at the time of exportation in the foreign countries from which imported, including the value of containers. The value of exports represents the cost of the merchandise at the time of exportation in the ports of the United States from which shipped. The ton equals 2,240 pounds.

The classification and figures relating to rubber are:

III. Materials, raw or partly manufactured.

62. India rubber and substitutes (including scrap). Unit of quantity, pound; units of value, dollar and Pan Americanos.

	Pounds.	Dollars.	Pan Americanos.
Calendar year 1919.			
Imports	576,708,524	1,108,130,782	8,244,655
Exports	13,362,685	1,648,931	

IV. Manufactured articles.

132. Rubber manufactures.			
Imports	1,004,051	5,020,255	
Exports	46,950,625	234,753,125	

PRINTERS' ROLLERS OF RUBBER.

It has been known for more than a generation that the printer's roller is an unsatisfactory product. Made of glue, molasses and glycerine, it spread the ink well, but was subject to changes of temperature and must be often renewed. Makers of these composition rollers all had their own special formulas. The simplest were about equal parts of glue and molasses for summer but for winter twice as much glue as molasses. One formula called for the addition of a little Paris white, while another maker added linseed oil, whitening and rosin.

From time to time rubber manufacturers sought to oust the glue and molasses roller by supplying one of rubber. For a long time these attempts were futile. Success has, however, at last been attained.

The B. F. Goodrich Co. are now supplying a roller of rubber, the "One-Set," that is soft and pliable, not destroyed by ink, distributes perfectly, is unaffected by winter's cold or summer's heat, requires no adjusting when properly set, and outlasts by a big margin the old-time roller. Another signal triumph for rubber.

BENT RIMS CAUSE MUCH TIRE TROUBLE.

Many motorists, were they to examine the wheels on their cars, would be surprised to notice that their rims are bent along the edges. Bent rims are a direct cause of rim cuts, of tires blowing from the rim, and of the breaking of the wire cables at the base of the tire.

When the wheel hits a frog or a switch of a street car track or a hole in the road, there is a tendency to flatten the rim, especially if the tire is under-inflated. The support of the rim is essential to the life of a tire. If it is bent so that it does not fit the tire and allows the sidewalls to bulge, trouble is to be expected unless immediate precautions are taken.

The Miller Rubber Co., Akron, Ohio, issues a timely warning that by truing-up their rims, motorists can prevent much tire trouble. A good rule to follow is to have both tires and rims inspected fortnightly. When rim trouble is found, it may usually be corrected by careful tapping with a ball hammer.

The State Savings & Trust Co., Akron, and the Merchants National Bank, Massillon, have been appointed receivers of the Biltwell Tire & Rubber Co., Barberton, Ohio, due, it is said, to money stringency, though the company claims solvency.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

TRADe generally shows a falling off from the activity of last year and the opinion is freely expressed that we are in for a period of slackness all around. Another claim for increased wages is confronting the managements of the works and the indications are that the matter will not be easily settled.

The development of rubber planting on the Amazon is a matter of interest to many besides those primarily concerned. The increase in the yield in the last ten years shows the latent possibilities of this district in the future for making up any deficiencies in the Eastern supply which may be caused by the spread of pests like the worm pest. This appears to be unknown in Brazil where the main bar to progress seems to lie in transport and labor difficulties, which will have to be overcome if the rubber is to compete economically with the product of the Far East. With regard to quality, I have not seen any definite statement as to whether the Brazilian plantation rubber ranks equally with the product of the wild trees in the same locality. If it does, then it would follow that the age of the tree is not a prime factor. But if it does not, one would still expect the plantation rubber grown in its original home and presumably coagulated by the native method to be free from the irregularities associated with the Far Eastern product.

Certain seers predicted a shortage in the supply of raw rubber for the world's requirements during the current year. There is no sign of this yet, judging by market quotations, and it may be taken that until world conditions get back to normal—always supposing there are not a series of revolutions—what may be considered the legitimate trend of trade will not be observable. No doubt a lot of people want rubber in some form or other, but they have got to pay for it and this is just where the difficulty comes in.

There is general agreement among manufacturers that business is very quiet at present and buyers seem to be waiting until sales are forced by the difficulty, monetary or otherwise, of holding large stocks. An interesting market feature which is causing comment is that Fine Hard Pará is quoted within a half penny of the price of plantation rubber and I have heard the opinion expressed that the demand will go up. It seems doubtful, however, if this will eventuate, because if both were purchasable at, say two shillings per pound, allowing for the loss on washing alone, the Brazilian would be two shillings sixpence per pound and the now increased cost of washing and drying have to be added to this.

A matter which is of deep concern to the trade is the recent death of W. G. Wilson, secretary of the India Rubber Manufacturers' Association and Joint Secretary of the National Joint Industrial Council of the Rubber Manufacturing Industry. Mr. Wilson was only forty-four years of age and there can be little doubt that he over-taxed his strength in his devotion to the interests of his duties during the strenuous times of the last few years. It will be by no means easy to fill his place.

UNITED RUBBER PRODUCTS CO., LIMITED.

The United Rubber Products Co., Limited, which has a capital of £250,000 in shilling shares, owns the Urcpo works of the New Urcpo Rubber Co., Manchester, and has lately obtained control of the rubber works of G. W. Loughton & Co., Limited, of Clayton, Manchester. A certain amount of mystery attaches to the business which is being carried on, this being associated with some recent method of utilizing waste rubber. Louis Alexander, who was prominent in the promotion of the Sorbo Rubber Sponge Co., is the leading spirit of the United Rubber Products Co., Limited.

CALLENDER'S CABLE CONSTRUCTION CO., LIMITED.

Callender's Cable Construction Co., Limited, showed an increased profit of £161,524 in 1919 and has paid 15 per cent against 12½ per cent in 1918. As the works at Eritt, London, and Leigh, Lancashire, are now relieved of special government work the additional plant and buildings which were erected during the war period are now available for the largely increased ordinary business. In order to finance this a new public issue of £400,000 Preference shares and £100,000 Ordinary shares has been made, the former at par and the latter at £1.2s. per share. It is stated that the sales for 1920 are double those for the same period of 1919.

CARRIAGE OF DANGEROUS GOODS.

A memorandum has recently been issued by the Board of Trade with reference to the carriage of dangerous goods on board ship and there are several references not without interest to the rubber trade. Not for the reason that the rubber manufacturer ships his own chemicals or is responsible for the safe carriage of goods which come from overseas, but rather because the remarks in the text are of general import. Thus with regard to carbon bisulphide it is stated that the vapor has a tendency to travel and if it finds its way to any surface sufficiently warm to ignite it the flame will flash back and ignite the liquid. This has occurred at twenty feet from the warm surface. The mere striking together of two pieces of iron within the inflammable atmosphere may cause ignition.

Aniline oil is stated to give off vapors which are poisonous if inhaled for some time. "Some time" strikes one as rather too indefinite. It is interesting to note that nothing is said regarding reclaimed rubber although some of the shipping companies decline to carry it, without much reason, in my opinion. The association with oil has raised the bar, as so many oil materials are liable to spontaneous combustion. In the memorandum it is recommended that cases containing oiled goods intended for exportation as merchandise should be perforated or otherwise ventilated. When oiled materials are used for packing, care should be taken to see that they have been properly dried and that the various folds do not overlap in such a way as to bring several thicknesses of the material together. If oiled clothing has been seasoned for at least a month after manufacture and is packed in hermetically sealed metal lined cases there should be no risk of spontaneous combustion. With regard to this it would be interesting to know if any cases of fire have occurred in the case of oil clothing in transit since the large expansion of the business in recent years.

It is stated that spontaneous combustion in the case of lampblack is extremely rare, but as there is a possibility of its taking place it should be kept protected from the wet. With regard to this somewhat disputatious matter, all I can say here is that spontaneous combustion of lampblack was not so extremely rare in rubber works in the past, whatever may be the case to-day. But a great deal depends upon the exact nature of the lampblack or what is sold as lampblack, some blacks being much more liable to fire than others. The Board of Trade is advised that india rubber solution comes under the heading of dangerous goods, and that it must not be treated as general cargo and covered with other goods. It may be shipped under deck provided it is made up in small collapsible lead tubes or in one-quarter and one-pound tins packed in sawdust in tin lined cases. The same precautions are to be taken with solutions of gutta percha in tetrachloride of carbon, because, although it is non-inflammable, it is an anesthetic like chloroform.

DUMPING.

What exactly is dumping? Definitions seem to vary according as to how the imported goods affect the individual pocket. On June 9 in the House of Commons the Under Secretary for the Board of Trade was questioned as to whether the dumping of French and American tires had caused the dismissal of 800 workmen at the Wood-Milne works, Leyland, and was further the cause of other manufacturers slowing down their output. A further question was whether the Government's anti-dumping legislation would be quickly introduced. On the latter point the answer was to the effect that no statement was possible at present. With regard to the general question, the Under Secretary said that he was not satisfied that the home industry was seriously affected nor had he any evidence that foreign tires were being dumped in this country. Obviously he does not treat the term sold as being synonymous with dumped, as his questioner seemed inclined to do. He also added that the export of rubber tires in the first five months of this year had exceeded the imports by about £600,000, while in 1913 the imports exceeded the exports by about £470,000. As the American invasion had not at that time gathered strength the total must have been mainly made up of French, German and Russian tires.

THE KING'S BIRTHDAY HONORS.

Among the recipients are one or two names known in the rubber trade. The knighthood bestowed on H. A. Wickham, as father of the rubber planting industry, is an honor which has been generally acclaimed. There is no need here to recapitulate the deeds in the earlier life of the recipient, as they are to be found in the rubber literature.

Philip S. Stott, who received a baronetcy, is a Lancashire man well known as a cotton mill architect. His connection with the rubber trade is not very close, but as a director of the large Dunlop Cotton Mills he may be said to be in touch with the industry.

W. H. Veno, who received a knighthood, is in somewhat the same category; although in business he is a manufacturing druggist, he has for some time had large financial interests in rubber manufacturing, being at the present time a director of the Monarch Rubber Co., Limited, of Manchester.

Mention may be made also of John Henderson Stewart, who receives a baronetcy. Although best known in other spheres of industry, he is chairman of the Sorbo Rubber Sponge Products, Limited, of London, a company which is now building a large new works at Woking, Surrey.

POTTERS ASBESTOS CO., LIMITED.

This concern, which has works at Rochdale and the neighboring towns of Littleborough, has been taken over by Bells United Asbestos Co., Limited, and some of the new machinery has been transferred to the works of the latter company at Harefield, Middlesex. The share capital of Potters is £68,600, and the chairman is Frank Turner, who is not now connected with the well-known asbestos concern of that name. The directorate of Bell's United Asbestos Co. is to be increased and Frank Turner will have a seat on the board. The Bell's United Asbestos Co. for last year paid a dividend of 12½ per cent, added to which was a bonus of 5 per cent.

LOUIS MINTON.

The business arrangement which has been in existence for many years between Louis Minton and Messrs. Tytké and King, rubber chemical manufacturers, of London, has recently been terminated. Mr. Minton, however, will continue at Trevelyan Buildings, Manchester, to cater for the rubber manufacturers' requirements in raw and reclaimed rubber, pigments, substitutes, accelerators, sulphur and other chemicals. Having been, prior to 1898, a rubber manufacturer, he can claim with reason to be in a special way qualified to supply goods suitable for the different branches of the trade.

ZAMA, LIMITED.

This company, which carries on a proofing business at Pendleton, Manchester, has recently been sold to Thos. Mellor & Sons, of Portland street, Manchester. During the war the spreading machines were fully engaged on special work, but latterly all classes of proofing for the trade have been undertaken. J. E. Baber, who has had considerable experience in the proofing industry, will act as manager under the new regime.

CHESS-BRAND, LIMITED.

This firm has gone into voluntary liquidation and the business of rubber sole and heel manufacturers will be continued at the works, which are situated at Middleton, Lancashire, by a new company called Chess & Stead, Limited, with George Metcalfe as managing director. The new company will also operate the Chess-Brand works at Strand, Gloucestershire, these having now passed into their possession with the Middleton works. These latter, it may be recalled, were started by Mr. Roberts when he was head of the Wood-Milne Co., Limited.

J. HALSTEAD & CO.

This firm at Crow Oak Works, Whitefield, Lancashire, is among the more recently started proofing works doing proofing for the trade. G. C. Pratt, who has had many years' experience on the rubber side, is proofing manager.

NOT DUMPING TIRES ON BRITISH AUTO MARKET.

According to the American Chamber of Commerce in London, it is understood that large quantities of American and French tires were being dumped on the British markets to the disadvantage of British manufacturers. Information given by the secretary to the Board of Trade, in reply to inquiries made by Members of Parliament, show that during the first five months of this year the export of tires exceeded in value the imports by over £600,000 sterling, and in the corresponding period of 1914 imports exceeded exports in value by £470,000 sterling.

The inquiries, says the American chamber, emanated from the report that a well known firm of tire manufacturers found it necessary to dismiss a large number of their workmen, and this was attributed to the dumping of foreign tires.

RUBBER GROWERS ASSIST RUBBER EXHIBITION.

The Fifth International Exhibition of Rubber, Other Tropical Products and Allied Industries and the International Rubber Congress to be held in connection with it at the Royal Agricultural Hall, London, in June, 1921, will receive the hearty support of the Rubber Growers' Association, as in 1914. Special committees are being appointed to deal with competitions, the plantation rubber section of the international congress and other matters. A rubber tennis court will again be a feature of the associations' exhibits. Sir Ernest Birch, K.C.M.G., is chairman both of the Rubber Growers' Association's special exhibition committee and of the committees for the exhibition organization. The exhibition offices are at 43 Essex street, Strand, London, W. C. 2.

BRAZILIAN SHIPPING FACILITIES WILL BE IMPROVED THROUGH the inauguration of monthly services by the Pacific-Argentine-Brazilian Line of San Francisco and the Lloyd Royal Belge Steamship Co. of Belgium. Steamers of the first-named company, after stopping at west coast ports, will call at those in Argentina, Uruguay and Brazil, and return by way of the Panama Canal. Those of the Belgian line will call at Antwerp, Rotterdam, Amsterdam, Hamburg, Brazilian ports, Montevideo, and Buenos Aires.

THE BUREAU OF EDUCATION IN THE PHILIPPINE ISLANDS is planning a course of athletic training that will require every public school to invest in athletic equipment. The increasingly popular games of baseball, indoor baseball, volley ball, soccer, golf, handball, and tennis are to be included.

The Rubber Industry in Germany.

By a Special Correspondent.

PUZZLED is the expression that exactly describes the state of mind of our rubber manufacturers at the present time.

They are puzzled that prices should decline in a market that has shown a rising tendency; they are puzzled about the fluctuations of the exchange value of the mark, and they are puzzled about the attitude of other markets toward Germany. These three problems have created a nervous tension that expressed itself in a renewed disorganization of the market which first appeared early in June and has steadily increased ever since. Much of the existing apprehension, no doubt, might be allayed if the German manufacturers were in full possession of the facts. But the news service is still very unsatisfactory, and, moreover, the Germans were never known to read foreign news with an unbiased mind. The trouble started with the sudden advance in the value of the mark in New York and other leading trading centers of the world. True, the recovery was not particularly striking and had been long talked of by every German merchant and manufacturer. But it seems that no one really expected it to happen. As all quotations for raw materials in Germany at the present time are based on foreign exchange, the increased price of the mark naturally had a depressing effect on prices. That means the mark which had had a value, say of 2 cents in the past, suddenly jumped to double its purchase value and the prices came down accordingly.

EFFECT OF ADVANCES IN GERMAN EXCHANGE.

The whole occurrence, of course, had nothing to do with the inherent purchasing value of the mark or the quality of the goods, but it naturally tended to unsettle prices generally. Values have been exceedingly high all through the period of reconstruction in Germany and Austria. In Austria no proper price quotation seems to exist at all. However, Vienna has felt the effect of the recovery of the mark through heavy fluctuations in values.

Steps are now being taken in Germany to bring the value of public services such as transportation, postal service, etc., into better relation to the actual value of the mark, and it is to be expected that this will soon lead to some sort of price stabilization. Only quite recently the Imperial Post Office settled the new rates for letters and other mail. Ordinary letters that formerly cost 10 pfennig are now costing 40 pfennig. Postal cards now cost 30 pfennig instead of 5 pfennig. The Post Office, therefore, assumes that the value of the German mark has depreciated approximately to one-fourth or one-fifth of its pre-war value. Naturally such an increase in postal rates has its bearing upon the whole price situation in the country. It affects mail advertising and the transaction of all business.

How upset are price quotations at the present time in Germany and Austria can be seen from the fact that tennis balls have been selling in Vienna for 200 to 300 kronen each, which is between \$40 and \$60 pre-war exchange. Automobiles were sold a short time ago in Vienna for the phenomenal sum of one million kronen, \$200,000 old exchange, but have come down now under the influence of the exchange recovery to half a million kronen. Raw material prices, of course, are all in the air. Rubber is quoted on the basis of American or English prices with the exchange fluctuations as the basis of the transaction, which makes the price change practically every day. Hemp yarn which sold for 32 cents a kilogram former exchange, is now not to be had at much below 36 marks or \$9 old exchange. Cotton yarns for weaving tire fabrics and similar materials have gone up to 150 marks a kilogram, \$36.00 old exchange, against a matter of 35 cents in the past. Still more pronounced are the price increases in such materials as asbestos; the best crude is now being sold at 150,000 marks a ton, compared to 1,300 marks

before the war. No wonder that great efforts were made to introduce substitutes. Substitute yarns made from old rags have been offered and new fiber plants have been tried out to replace hemp and cotton. For a while it was the fashion to think these substitute materials were superior to the real article. Since the return of peace, however, the mask has been dropped, and manufacturers admit that the substitutes have been a flat failure in most instances and that the industry will require standard materials if it is to continue manufacturing on a profitable basis. Today, wherever the German substitute-made article meets rubber goods made abroad from standard materials, the German goods lose out, even in the domestic market. This is a very serious matter for the German rubber industry and there is no doubt that steps will have to be taken to make available sufficient quantities of standard raw materials if the industry shall ever recover again. This also has considerable bearing upon the future of German rubber exports.

FOREIGN RUBBER TRADE DESTROYED.

Right after the signing of the armistice German rubber manufacturers were very hopeful for the resumption of their former export trade. The sentiment of France was then not fully realized and the Germans believed that they would be allowed to enter the community of nations again on equal terms. These expectations have now been destroyed, and nearly two years have passed in which the rubber industry has been retarded and its difficulties intensified. It is now recognized that the foreign trading organization of the German rubber industry is completely destroyed. The well equipped agencies in enemy countries have been sold, as for instance the fine London business of the Continental company, and it has not been possible to keep up agencies in neutral countries owing to the high cost entailed. Shortly after the signing of the armistice German manufacturers made attempts to get in touch with some of their customers. They found, however, more competition than had been expected and that the American rubber industry especially had gained ascendancy in foreign business. The Germans, therefore, will have to rebuild their rubber business entirely, and the question has been discussed whether under such circumstances it would be better to give up exporting entirely. This, however, is a difficult accomplishment.

RUBBER INDUSTRY HANDICAPPED.

The German rubber industry has invested heavily in equipment and buildings that could not be turned easily to other purposes. Also, Germany has nearly 80,000 men trained in rubber manufacturing for whom no new employment could be found. The German system of training industrial labor, although very efficient in the production of high-class operatives, has the disadvantage that it makes specialists who cannot change over easily from one industry to another. To reduce rubber production would therefore spell unemployment for a large number of excellently trained men, which is a thing to be avoided at any cost. This problem is still more complicated by the fact that sales in many of the best paying branches of the rubber industry are declining heavily. Germany has to pay off an enormous debt and the Germans will be poor for many years to come. Under such circumstances it has become a necessity to cut down all expenditures for luxuries. The time has come when the possession of an automobile is not quite the thing and statistics seem to indicate a rapid decline in the sale of automobiles. The automobile business in consequence is expected to decline heavily during the coming years. It is not quite clear whether the demand for bicycle tires will recompense sufficiently the industry for its loss in sales of the more costly article. Another difficulty

to be faced in this respect is the rising cost of production. The low value of the mark not only makes the purchase of raw materials difficult, but measured by international standards Germany today buys much more expensively than any other country of the world. It follows that each article carries a severe initial handicap in manufacturing cost that cannot be overcome easily. Under such circumstances it is rather astonishing to see that the German Government seems to be inclined to cut down export activities still further by creating a special taxation of export values for the purpose of raising the German revenues. This matter is now under consideration and rubber manufacturers, especially, are up in arms against such a measure. Whether they will succeed is doubtful in view of the very serious financial condition of the country which calls for a practically complete divestment of all surplus property. Incidentally, there is hardly any money available for advertising purposes, and foreign advertising that had been continued by several firms during the first years of the war as a matter of good policy has now ceased entirely.

PRICES OF RUBBER GOODS PROHIBITIVE.

These export troubles are only a reflection of the more acute domestic difficulties. Here are a few instances that may illustrate the situation. All through the war and following, canning and preserving have been encouraged. There is little wasted just now in Germany. But the rubber rings used in preserving have gone up excessively in price. Formerly such a ring could be had for two cents or so. Today, 50 cents and even 75 cents on the basis of the old exchange must be paid. Also the rings are not of the former quality. The German jar-ring industry has been very active in the past and a great number of specialties were introduced to make the opening of the cans easier. Most of these specialties made opening dependent upon the tearing of the ring. In addition, they required more rubber for their manufacture. With the present prices, housewives do not care to buy such rings and the simpler forms have been introduced generally. As the rubber rings were so expensive, substitutes have been offered. These, however, have not turned out very satisfactorily as was the case with most substitutes. The present situation is that the German market is undersupplied with rings and that dealers are trying frantically to increase their stocks. Rubber jar rings today are an article bought and sold in a speculative manner as shares on the New York Stock Exchange.

PROFITEERING RAMPANT.

The same applies to belting. But the belting dealers have had a severe shock recently owing to the heavy break in prices explained in the beginning of this letter. It is suspected that a large quantity of belting has been bought by dealers for future sale at large profits; profiteering, in fact, is just as rampant in Germany today as it seems to be in other parts of the world. Now, prices have gone down and the speculators wonder what to do with their stocks. It is expected that rubber belting will find more and more appreciation in Germany as soon as a better quality can be made than is the case just now. Rubber manufacturers complain that the rubber belt has not had a fair chance during the past and that it has not been used wisely during the war. Together with the drop in the cost of belting in Germany has come a general depression of all trading, caused principally by an extensive disorganization of values. Orders are coming in very irregularly. The rubber industry has probably been hit least by this development as the dependency of the industry on foreign supplies acts as a stabilizing factor upon prices. But there is no doubt that the rubber goods dealers are becoming more and more careful and while trying to keep up prices they admit that orders are not obtained at the present quotations. The German manufacturers who are keen to continue present prices are making special efforts to keep up the spirit of the

market. They point out that prices in other countries are high and that the output of rubber goods outside of Germany is also considerably below the actual demand. There seems to be some truth in this statement, as there is a noticeable falling off of foreign rubber supplies in the domestic market. For a while the "Hole in the West" and the new hole in the East offered by Danzig were giving to enterprising dealers an excellent opportunity of introducing expensive foreign rubber goods. It is astonishing that notwithstanding the financial condition of the country and the high prices that had to be charged for such goods, there was still a demand for English tennis balls. Recently no English tennis balls were to be had in Berlin at any price and our German sportsmen are losing their mental balance because the German ball is inferior in quality to the English and does not have the correct weight. This applies to many other sporting goods made from India rubber, of which large quantities had been imported immediately after the war.

INDUSTRIAL FAIRS NOT BENEFICIAL.

The spring fair in Frankfurt, which has been held for the purpose of giving the German manufacturer a chance to keep up his connection with the occupied territory, has not been as successful as the autumn fair of last year. It suffered under the French occupation which then was in progress and still more under the generally disorganized transportation and traveling conditions that followed the famous Kapp revolution. The sales in the rubber section, therefore, were not very good. This section, in fact, was rather small, considering the general importance of West Germany as a rubber producer, and only surgical rubber goods were comparatively well represented. There have sprung up in Germany quite a number of these fairs destined either to aid in the sale of German goods or to help the import of raw materials. It is, however, very doubtful whether these enterprises will really benefit the importer of raw materials, as the German manufacturer is not inclined to buy in this manner, but prefers to deal with importers known to him. If American exporters of reclaimed rubber and other materials wish to get in touch with Germany, they should establish proper trading agencies to handle not only the German market but also that of Poland, Bohemia, and the former Austria, all of which seem to hold a good promise for the future.

RUBBER SITUATION IMPROVING.

The present depression in the German market will not be of very long duration. It will come to an end with the expected stabilization of the exchanges. This is indicated to some extent by the report of the Demobilization Commission, which stated that the rubber industry was comparatively busy during the first quarter of the year and had sufficient orders to guarantee a favorable occupation rate. In the technical and surgical section of the industry overtime had to be resorted to. The general situation of the industry is very much improved as compared with the same period during the preceding year, notwithstanding all present troubles.

MANUFACTURE OF SYNTHETIC RUBBER IN GERMANY DISCONTINUED.

Authentic news comes from Germany about the discontinuation of the manufacture of synthetic rubber by the Farben fabriken vorm. Friedrich Bayer & Co. This company had built during the war a large plant for the manufacture of synthetic rubber in Leverkusen and it had become possible to produce considerable quantities of substitute rubber. Part of this rubber has been used during the war by the German army for tires and for a while German scientists and economists were very hopeful that the manufacture of synthetic rubber could be firmly established in Germany. During the recent general meeting of the shareholders of the company it was announced that the company has

closed its Leverkusen rubber works and does not intend to continue the manufacture of synthetic rubber as part of its activities. The rapid rise in the cost of acetone and aluminum has increased the cost of production as such a rate that today the price of the synthetic rubber exceeds that of the natural product. The company discontinued manufacturing immediately after the cessation of hostilities and the existing stocks of the material were sold out.

NOTES OF THE TRADE.

The depression in the German rubber goods market continues. All branches of the industry are finding their market considerably curtailed and evidence of overstocking in the retail market begins to appear everywhere. The manufacturers of surgical rubber goods who had been fairly busy during May and June now begin to feel the slump, and complaints are heard about cancellation of orders. The cause of the present difficulty in the surgical rubber industry differs somewhat from that in most other branches of the rubber industry. The demand for surgical rubber goods has naturally been very active immediately after the war and the dealers in consequence have been in the habit of carrying much larger stocks than would be necessary in normal times. They find now that they cannot dispose of the expected quantities and naturally try to reduce their commitments. Surgical rubber goods have been sold at rather excessive prices by the dealers and there is no denying that a certain amount of profiteering has taken place in this line. The trade associations have realized this fact and while they have urged high prices during the former shortage they are now recommending reductions amounting to 33 and even 50 per cent.

Another branch of the industry is feeling the situation very acutely—namely, the makers of sporting goods and toys. The number of rubber toy manufacturers declined during the war because no rubber was obtainable. Sporting goods still have been made but in reduced quantities. When the war ended the industry tried to pick up its old connections again and the results of the first trading fairs seemed to be most promising. Large orders were received from abroad and the aspect was pleasing enough. The last weeks, however, have proved a decided disappointment. The German rubber toy industry has gained its influence by the high quantity of its production as well as by the cheap price for which the goods have been sold. It appears now that the output of more recent times has not been very satisfactory and that, in consequence, orders have declined. Also the price of the toys has reached a level which makes the German industry less competitive than in the past.

The Bureau for the Control of Foreign Trade in Rubber Materials and Rubber Goods (the *Aussenhandels Nebenstelle Kautschuk*) has now commenced operation. It is in charge of Walter Lindemann, the manager of the central union of German rubber goods manufacturers. The work of the Bureau will be guided by the following principles: the import of raw rubber, gutta percha, balata, and scrap rubber, is free from all restrictions and, therefore, is not subject to the control of the Bureau. The import of manufactures of rubber and goods for further use in manufacturing is in principle prohibited. Exceptions will be made in the case of such goods as are urgently required for the continuation of German economic life and cannot be manufactured in Germany or cannot be had in a reasonable time. The importer will have to prove the urgency of his request. The import of reclaimed rubber is limited to 3,000 tons in all. The import of factice is not permitted unless proof is provided that the required quantities or qualities cannot be had in Germany.

The export of raw rubber, gutta percha, balata, and scrap, is permitted. The export of manufactures of rubber is permitted as long as the price is not below the domestic minimum prices. The export of reclaimed rubber is permitted. The export of factice is permitted with the exception of such qualities as are

manufactured by the use of rape-seed oil. Exception can be made under certain circumstances. The exporter may bill his export goods either in German or foreign money units.

The *Liga Gummizwerke Heinrich Peter & Co., G. m. b. H.*, in Frankfurt-on-the-Main, has increased its capital to 3,000,000 marks.

The *Continental Caoutchouc und Gutta-percha Compagnie* in Hanover has increased its capital from 15,000,000 to 34,500,000 marks.

The *Ungarische Gummwaren Fabrik A. G.* in Budapest, Hungary, has increased its capital from 6,000,000 kronen to 10,000,000 kronen.

FOREIGN NOTES.

FRENCH EQUATORIAL AFRICA exported 2,221,133 kilos of rubber in 1919, as compared with 1,980,723 kilos in 1918 and 1,756,436 kilos in 1913, the year before the war.

France's exports of rubber manufactures in 1919 amounted to 226,000,000 francs in value. The figures for previous years are:

1918	francs 96,000,000	1915	francs 80,000,000
1917	francs 117,000,000	1914	francs 85,000,000
1916	francs 108,000,000	1913	francs 100,000,000

To the Alsace-Lorraine production much of the increment is due.

Denmark imported in 1919 rubber of the value of 115,000,000 kroner.

Holland in the first quarter of 1920 did a less satisfactory business in rubber tires than in the year before, because exportation was made more difficult and the importation of foreign tires was made easier. On the other hand, no complaint is to be found as regards the manufactures of technical and sanitary rubber goods other than dock and transportation strikes. Imports of tires for the quarter amounted to 3,145,551 gulden and exports, to 147,411 gulden. Imports of raw rubber amounted to 2,126,672 kilos, of which 2,022,578 came from the Dutch East Indies and 19,940 kilos of balata from Curaçao. Exports of rubber amounted to 1,655,043 kilos, of which 1,085,983 kilos went to the United States, and besides 20,393 kilos of balata were exported.

A company has been registered in Bombay, India, as "The Pioneer Rubber & Industrial Co., Ltd.," with a capital of £500,000 English, (50 lakhs of rupees), to reclaim waste rubber and manufacture rubber goods, such as tires, tubes, surgical goods, heels, waterproof clothing, and ebonite. Sir Fazulbhoy Currimbhoy is chairman of the board of directors, and Manu Subedar & Co. are the managing agents.

CORD TIRES TO BE MADE IN CUBA.

The Cuban Tire & Rubber Co. (*Compañía Cubana de Zunchos y Goma*), Havana, Cuba, said to be the pioneer tire factory in Latin-America, was incorporated in August, 1916, with an authorized capital of \$1,750,000 for the manufacture of tires, tubes, and other rubber goods.

Under the efficient guidance of Raul Godoy, general manager, the company has steadily progressed and is now making 150 fabric tires, 500 tubes, some heels, and mechanical goods for the sugar centrals. Appreciating the necessity of adding cord tires to the company's products, Mr. Godoy recently spent six months in the United States acquiring the necessary technical information and mechanical equipment for making high-grade cord tires.

RAUL GODOY.

News from British Guiana and Trinidad.

Special Correspondence.

FRANK DAPHNE, the solicitor to the Essequibo Rubber & Tobacco Estates Defence Committee, has issued the final report and audited accounts to the subscribers to the fund.

There was complicated and protracted litigation and the winding up of the company was not completed till 1919, but in the end the subscribers to the fund, about 300 in number, have received a return (including an interim distribution in 1915) equivalent to 7s. in the £ on the amount they paid for shares. They are to be congratulated, for unfortunately proceedings of this kind rarely terminate so satisfactorily. It should be added that only shareholders who subscribed to the fund benefited from the efforts of the committee.

The company was registered in Georgetown, British Guiana, on April 6, 1910, with a nominal capital of £100,000 in five-shilling shares, to acquire the benefit of four licenses granting the right to collect rubber, balata and like substances over an area of 200 square miles of the Crown Lands in British Guiana and to develop the land as a rubber, tobacco, and general produce estate. The licenses were granted to J. M. Ho-A-Hing on June 5, 1906, for a term of 10 years at an annual total rental of \$80, and a royalty of two cents on every pound of rubber or balata collected. The nominal promoter of the company was the Industrial Selections, Limited, who received £4,500 for preliminary expenses but the actual promoter was Joseph Chansay, the beneficial owner of practically the whole of the issued capital of Industrial Selections, Limited. The first directors of the company were Sir Henry E. Dering, Bart., J. P., Sir Henry Seton-Karr, C. M. G., Captain W. J. M. Hill and William O'Malley, M. P.

Captain Hill resigned on June 30, 1911, and P. Halcrow was appointed in his stead on February 7, 1912. On February 23, 1912, Sir Henry Dering tendered his resignation which was accepted on March 4.

The 400,000 shares comprising the nominal capital of the company were offered for subscription at par by a prospectus dated April 13, 1910, and published by the "Financial Outlook," which unhesitatingly recommended the company.

The company's affairs were ordered to be wound up on June 25, 1912, on the petition of six shareholders (1,480 shares) supported by 28 other shareholders (5,185 shares), presented on May 4. The statement as prepared by the directors disclosed a deficit of £68,992.4s. 5d.

The property of the company was sold at auction in August, 1912, when a private offer of \$16,800 by W. L. Seymour, the representative of an English syndicate, was accepted for the Liberty Island Estates held under a 99 years' lease from the Government.

A prominent British Guiana journal, dealing with the above, recently said:

The announcement that the subscribers to the Essequibo Rubber & Tobacco Estates Defence Fund are to receive a dividend of 7s. in a pound recalls the rubber boom of almost a decade ago, when British Guiana was to share in the fabulous wealth then being won from this industry. Enthusiasm ran so high that the Department of Science and Agriculture went to the expense of producing a brochure informing the world that there were some nine million acres available for rubber cultivation in the colony and that the rubber grown here was equal to the best product of the East. Several companies were formed and so confident was everybody in the colony that we had a rubber industry that we even had the temerity to exhibit at the Rubber Exhibition in London. That the boasts of the Department of Science and Agriculture as to the quality of British Guiana rubber were not idle was borne out by the fact that the colony carried off two cups. Unfortunately many of the companies that were formed were sponsored by busy speculators, who were far more anxious

to grow rich quickly than they were to make money honestly by the development of an industry that had the best of prospects—and still has.

The boom soon collapsed and the rubber industry of British Guiana became such a minor affair as to be forgotten for all practical purposes. It had not altogether died, however, for in 1918 the exports reached the total of 23,854 pounds. This was not a great contribution to the world's supply, it is true, but still sufficient to justify the assertion that the industry is alive. In the long run it will probably be found a good thing that the foundations of the industry were not laid in the treacherous quicksands of a boom. When it does take its proper place in the industrial economy of the colony it will not at any rate owe

MULTIPLE "V" TAPPING, RICHMOND ESTATE, TOBAGO.

its very existence to an abnormally inflated price of 12s. 6d. a pound, and the time may come when this colony will be able to sell its rubber in the markets of the world at the world's price. At present, according to the representative of one of the largest rubber cultivators in the colony, owing to labor shortage and leaf disease, it is not possible to tap the colony's rubber trees at a profit. The price in London to-day is ruling at only 2s. 3d. a pound, and it is held that with the high price of labor it is impossible to compete with the East.

It is interesting to glance for a moment at the progress made in Trinidad, which was also to become a "rubber country" a few years ago. Trinidad has not become a rubber country, but its industry has developed better than ours and there seems to be a little more optimism about it than there is here. The exports in 1919 amounted to 41,000 pounds and the industry evidently had sufficient life in it to be worthy of discussion by the excellent Agricultural Society that looks after these things in

Trinidad. (Incidentally, we have nothing quite like the Trinidad Agricultural Society in the colony.) This discussion elicited the fact that the Department of Agriculture in Trinidad has not abandoned its experiments with rubber, as we believe is the case in this colony. The Director of Agriculture gave some particulars of tapping experiments that are of great moment because they go far to meet the principal difficulty in this colony, namely the labor shortage. *Hevea* trees are supposed to require tapping every other day. Mr. Freeman resolved to try a series of experiments, tapping every two days, and every six. The results were more than gratifying. The trees tapped three times a week yielded 22½ pounds a tree in 4½ years, those twice a week 19½ pounds and those once a week 9½ pounds. Thus, by tapping three times in two weeks instead of six times they get a yield only of 3 pounds less per tree in 4½ years. The importance of this experiment upon the labor difficulty is obvious. Trinidad is fortunate in having a rubber enthusiast. E. A. Robinson grows rubber, not to test theories as the Department of Agriculture does, or because it amuses him, but as a commercial proposition. In 1919 Mr. Robinson organized labor to tap 1,500 trees and produced 28,000 pounds and he got roughly 400 pounds to the acre, whereas in the East the average is as follows: southern Java 218 pounds; Straits Settlements 247 pounds; Ceylon 312 pounds; Java 322 pounds; Sumatra 326 pounds; and in one district of the Federated Malay States 382 pounds. In the East, rubber is clean-weeded, forked and manured; in Trinidad Mr. Robinson does nothing but drain his land. For labor he uses boys and girls, also adults of both sexes, and pays them 40 and 50 cents a day. As they can do a day's task of 200 trees by 11 o'clock they can make much more money with extra work. Mr. Robinson is an exception. It is not believed that rubber can be grown profitably in Trinidad any more than it is believed that it can be grown profitably in this colony. Nevertheless he is planning to produce 70,000 pounds of rubber this year. We should not be surprised if the foundation of another big industry is being laid in Trinidad.

MALAYAN CRUDE RUBBER INDUSTRY IN 1919.

By Consul General, Edwin N. Gunsaulus,
Singapore, Straits Settlements.

THE ANNUAL REPORT of the Planters' Association of Malaya for the year 1919, presented at a meeting of the Association held a few days ago, contains much interesting information relative to the rubber industry during the period under review. Some of the more salient points of this report are given below:

The year 1919 commenced with heavy stocks in this country, and in many directions fears were expressed as to the ability of the manufacturers to absorb them. Crop restrictions were relaxed during the first part of the year and the shortage in shipping did much to augment this. A great deal of speculation resulted on the signing of the armistice and temporarily affected prices in Singapore, but the removal of the American import restrictions brought a more steady influence to bear on the position, and in the ensuing months of the year matters adjusted themselves more nearly to a resumption of the natural law of supply and demand.

The output of rubber in Malaya during 1919 and the previous three years was as follows:

Provinces.	1916.	1917.	1918.	1919.	Increase in 1919 over 1918.
	Tons.	Tons.	Tons.	Tons.	Per cent.
Selangor	25,163	32,614	31,417	39,570	26
Perak	23,431	30,129	30,219	41,580	37
Johore	14,004	19,089	22,816	27,890	22
Malacca	12,388	16,675	16,693	22,414	34
Negri Sembilan	12,179	15,526	15,154	22,846	50
Penang, Province Wellesley and Dindings	4,935	5,596	5,762	8,089	40
Kedah	3,314	5,266	5,276	6,472	22
Singapore	628	2,471	2,600	3,900	23
Pahang	1,001	1,562	1,494	2,457	64
Kelantan	1,010	1,490	1,745	2,077	19
Trengganu	20	105	188	244	29
Total	99,063	129,923	133,364	176,839	32

RUBBER PRODUCTION.

During the past 11 years the total production has been as follows:

Years.	Tons.
1919	176,839
1918	133,364
1917	129,923
1916	99,063
1915	70,214
1914	47,006
1913	33,641
1912	20,327
1911	10,782
1910	6,504
1909	3,340

FOREIGN COMMERCE IN RUBBER—WORLD PRODUCTION.

The export figures for 1919 are interesting when compared with the production for the year, as they show some 22,918 tons more were shipped than the total of the Malayan crop, while at the end of 1918 only 6,312 tons are given as having remained unshipped.

The Board of Trade returns for 1919 give the total imports of rubber to the United Kingdom at 101,891 tons, of which amount 58,132 tons were supplied by the Federated Malay States and Straits Settlements. On December 31 stocks of plantation grades at London and Liverpool amounted to 23,236 tons. In ten months ending October, 1919, the United States took 124,339 tons of rubber from the British Indies, an increase of 30,904 tons over the amount supplied during the corresponding period in 1918.

According to Rickinson's "World Rubber Position," the world's production of plantation rubber in 1919 was estimated at 285,225 tons, Brazilian and wild rubbers at 41,635 tons, and the amount afloat on December 31, 1919, at 47,340 tons, making a total of 374,200 tons. Of this amount 55,000 tons were produced in 1918.

SHARE OF CONSUMING COUNTRIES—TREMENDOUS INCREASE IN DEMAND FOR RUBBER.

The consuming countries in their order of importance were:

	Per Cent.
America	65
United Kingdom	13
France	6.5
Italy, etc.	4
India	3.5
Japan and Australia	3.5
Russia	0.5
Scandinavia	0.5
Belgium	1.5
Germany, etc.	1

It is pointed out that during the past 10 years the consumption of rubber in the United States has shown an average increase of 27¾ per cent per annum. Should the spread of motor traction result in an annual increase in the world's consumption equal to 25 per cent, it would be necessary by 1924 to harvest from the plantations a crop of no less than 766 pounds per acre in order to meet the demand. It, therefore, follows as a safe conclusion that we are approaching a time when the supplies of raw material will not be large enough to meet the demand.

Most of the rubber produced is for the manufacture of tires, and if this demand is maintained during the next few years there will not be enough rubber available, as only the present planted area of 2,910,750 acres will be tappable during the next five years.

The *Société Anonyme des Plantations de Telok-Dalam* of Antwerp, Belgium, in its tenth annual report for 1919, announces profits of 1,691,460.74 francs. The company owns 4,405 acres of land in Asahan, Sumatra, of which 2,405 acres are under cultivation. This yielded, in 1919, 909,540 pounds of rubber instead of the anticipated 720,310 pounds; the average price obtained for it was 635 francs a kilo, while in 1918 the price obtained was 387 francs. The number of trees per acre when the company started was 105; this has been cut down to 74 and this year 5 trees an acre more will be removed. In 1918 the yield was 5,178 pounds per tree and 384.8 pounds per acre; last year it was 5,883 pounds per tree and 393.05 pounds per acre. The president of the company is E. Bunge and among the directors are A. and E. Grisar.

THE RUBBER INDUSTRY IN THE NETHERLAND EAST INDIES.

By Our Regular Correspondent.

IN CONSIDERING the prospects for Netherland East Indian agricultural products in 1920, a local authority declares that the impoverished condition of Europe will not affect trade to such an extent as might be expected, because the United States and several Asiatic countries have proved to be large consumers of colonial products.

He concludes by pointing out that the labor unrest all over the world has also invaded these parts and should not be lightly considered.

LABOR TROUBLES AND THE CURE.

The labor problem is more complex here than it is in America. Here we have not only the European employees on the estates to consider but also coolie labor. That employers and the Government, both, are alive to the need of some action is abundantly evident. The local government has just published a draft of regulations intended to benefit the European assistants of the east coast of Sumatra, and it is supposed that similar regulations will be drawn up for Java and Madura.

The regulations lay down terms concerning the working contract of an employee, stipulating that he shall have leave of absence of at least one month each year for the first six years, and foreign leave of eight months if he has been with an employer for over six years. One clause provides that any condition made by the employer to prevent directly or indirectly the marriage of an employee shall be void.

One of the foremost companies active in improving the condition of its employees is the Holland-American Plantation Co., a subsidiary of the United States Rubber Plantations, Inc., that has recently fixed salaries for field assistants as follows: begin-

	Production.				Exports.			
	1914.	1915.	1916.	1917.	1914.	1915.	1916.	1917.

ner's salary, fl. 300 (one florin equals 40 cents) per month; after the first year this is increased by fl. 50 a month each year, until the employee has been with the concern 14 years, when he will receive a salary of fl. 800 per month. On January 1, 1920, a new ruling went into effect which provides for pensions. The maximum pension after 20 years' service and at the age of 45 years, or in case of illness making the employee an invalid, is fl. 2,400 per annum, minus 2 per cent of the bonus earned since January 1, 1918. At death the widow receives 60 per cent of the maximum pension, plus 12 1/2 per cent for each child; this pension is also subject to subtraction of 2 per cent of the bonus earned since January 1, 1918.

Other rubber planting companies that have provided pensions for their employees are the Deli-Batavia Rubber Co.,—fl. 1,000 per annum after 18 years' service; the Amsterdam Rubber Cultivating Co. and the Netherlands Rubber Co.,—each fl. 1,200 after 18 years' service; Tjinta Radja—a lump sum of fl. 10,000 after 15 years; Société Financière—a lump sum of fl. 12,000 after 15 years' service.

As for the coolies, efforts are being made to abolish the recruiting system and contract labor as it now exists and to substitute so-called free labor. It is proposed to bring this about gradually, each year reducing the amount of contract labor and correspondingly increasing the amount of free labor, until all labor will be free.

TAXES.

A good deal of excitement has been caused here in export circles where "time business" is the custom, by the proposed export taxes with a sliding scale. Government officials had proposed a means of protecting time business, which would otherwise receive unfair treatment under a sliding tax scale. It appears, however, that the remedy is worse than the disease, for the proposed protection—an export permit subject to innumerable conditions—is so bound up in red tape that instead of being protected, time business would be seriously hampered.

Therefore, at a recent gathering at Djacia, where delegates from the chief commercial associations of the island convened to discuss the matter, it was decided to cable to the Minister of Colonies in Holland protesting against the proposed measure, and suggesting a stamp tax instead of the much debated duty.

The following table shows how the tax would be regulated on rubber:

If the market price per half-kilo of rubber is:

fl. 0.75 or less.....	Nil.
fl. 0.76 to fl. 1.50.....	25% of value.
fl. 1.51 to fl. 2.25.....	3% of value.
fl. 2.26 and over.....	4% of value.

In addition to this tax, the rubber shipper will have another item to deal with in making up his cost account, namely, a 15 per cent increase in freight charges, announced by the Netherlands-Indies Railways; this is to go into effect on August 1, 1920.

PRODUCTION AND EXPORTS OF RUBBER.

The International Association for the Rubber Planting Industry in the Netherland East Indies publishes the following table of the production and export of rubber for the entire Netherland East Indies during the period 1914-1918. The quantities are given in tons of 1,000 kilo (2,204 pounds).

LATEX PRODUCTION AND ANATOMICAL STRUCTURE OF HEVEA.

At a recent meeting of the Rubber Planters' Association, Bobiloff discussed the formation of latex and the connection between the anatomical structure and latex production of *Hevea*. From experiments with isolated pieces of bark, he came to the conclusion that after tapping, a new formation of latex takes place, which he believes may be influenced by the presence of amylin. He further found that on the whole the best latex producers had the greatest number of layers of latex canals. In making experiments on bark, age was a great factor.

Other investigators found that while it was not always true of a group of good producers that the amount of latex produced runs parallel with the number of latex rings, this correspondence was noted when a mixed group of good, bad, and medium producers was tested. It has been pointed out that where a plantation has fared so badly that the usual method of finding good producers does not work, investigation of the bark might become a trustworthy aid in thinning.

NOTES.

During the last quarter of 1919, Djambi exported 2,057,650 kilos of rubber and 109,196 kilos of gutta jelutong. Reports about the condition of the crops were satisfactory, expansion of plantings taking place regularly.

It is reported that the Green Star Steamship Co., of New York, will commence regular service between the Netherlands Indies and New York and San Francisco.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED JUNE 8, 1920.

- N^O. 1,342,461. Cushion wheel. G. M. Peters, Kirkwood, Mo.
 1,342,562. Tire. A. J. Meyer, Chicago, Ill.
 1,342,597. Artificial palm to be worn on the hand as a foot-treating appliance. H. A. Post, Kansas City, Mo.
 1,342,611. Storage battery separator and method of manufacture. T. A. Ward, Cleveland, O.
 1,342,622. Split rim for tires. R. S. Bryant, assignor by mesne assignments to The Standard Parts Co.—both of Cleveland, O.
 1,342,700. Tire gun operated by rubber hand. J. A. Talbot, assignor to E. E. Talbot—both of Walla Walla, Wash.
 1,342,731. Display stand for tires. C. W. Veim, assignor to The Gates Rubber Co.—both of Denver, Col.
 1,342,736. Self-filling fountain pen with collapsible ink reservoir. M. Borbeck, assignor to Houston Fountain Pen Co.—both of Sioux City, Iowa.
 1,342,994. Bath spray. P. J. Fitzgerald, assignor to The Fitzgerald Manufacturing Co.—both of Torrington, Conn.
 1,343,997. Embalming device. C. S. Harrell, Lexington, Miss.
 1,343,055. Aeronautic device with inflatable pockets to be worn by individuals. J. Kropacz, assignor of one-third to J. Jakuriecz—both of Calgary, Alberta, Canada.
 1,343,101. Treat with handle of insulating material. J. A. Weaver, Baltimore, Md.
 1,343,108. Flame-throwing sterilizing apparatus with rubber bulb. I. W. P. Buchanan, Lebanon, Tenn.
 1,343,113. Nursing bottle attachment to prevent collapsing of nipple. L. D. Clark, Walla Walla, Mo.
 1,343,154. Cushion tire. W. Oestmann, St. Charles, Mo.
 1,343,155. Resilient tire. F. Perdala, Newark, N. J.
 1,343,165. Submarine radio system with highly insulated antennae. P. E. Stogoff, New York City.

ISSUED JUNE 15, 1920.

- 1,343,213. Resilient tire and filling therefor. J. Stander, Brooklyn, N. Y.
 1,343,230. Windshield wiper. V. H. Christen, Toledo, Ohio.
 1,343,357. Pneumatic cushion. A. C. Eggers, Brooklyn, N. Y., assignor to The Goodyear India Rubber Glove Mfg. Co., Naugatuck, Conn.
 1,343,368. Material for reinforcing rubber articles and method of making same. R. R. Sanger, assignor to The Mechanical Rubber Co.—both in Ohio.
 1,343,380. Hard rubber battery jar and method of manufacture. H. Weida, Highland Park, N. J., assignor to The India Rubber Co., Erie, Pa.
 1,343,383. Sole-cutting die with sheet rubber secured to outer surface to furnish unbroken surface to retain operator's grasp. T. W. Biello, Long Island City, N. Y., assignor by mesne assignments to United Shoe Machinery Corporation, Paterson, N. J.
 1,343,394. Demountable rim for tires. O. L. J. Ingle, Walla Walla, Wash.
 1,343,418. Laminated armor for inner tubes. H. M. Stevens, Indianapolis, Ind.
 1,343,521. Fountain pen. A. C. Rader, Alta, Iowa.
 1,343,526. Tire support. H. M. Smith, Buffalo, N. Y.
 1,343,528. Cushion heel. C. C. Stolzberg, Elyria, Ohio.
 1,343,540. Vehicle tire. J. Allend, Philadelphia, Penn.
 1,343,621. Fountain pen cleaner. C. W. Garver, Ashland, Ohio.
 1,343,684. Wheel cushion and means for mounting same. A. L. Runyan, Omaha, Neb.
 1,343,685. Resilient tire filler. A. L. Runyan, Omaha, Neb.
 1,343,713. Dental massage and polishing appliance with waterproof lining and elastic contracting means. C. W. Fuller, Yonkers, N. Y.
 1,343,736. Hatpin guard connected by elastic band. J. B. Maserang, Belleville, Ill.
 1,343,787. Syringe. E. Neil, Nashville, Tenn.
 1,343,853. Hose coupling. A. Rubin, New York City.
 1,343,860. Spring tire. C. E. Williams, Pittsburgh, Penn.
 1,343,861. Spring tire. C. E. Williams, Pittsburgh, Penn.
 1,343,890. Bulb for tank valves. A. T. Hopkins, assignor to The Mechanical Rubber Co.—both of Cleveland, Ohio.

ISSUED JUNE 22, 1920.

- 1,343,910. Tension device for printing-press rolls. C. T. Evans, assignor to The Cutler-Hammer Manufacturing Co.—both of Milwaukee, Wis.
 1,343,949. Vacuum cup fastening means for dental suction plates. G. S. Whitaker, Gloversville, N. Y.
 1,343,950. Dental suction device. G. S. Whitaker, Gloversville, N. Y.
 1,343,967. Hose coupling. H. R. Gilson, New Rochelle, assignor to New York Belting & Packing Co., New York City—both in New York.
 1,344,025. Tire. F. Ditchfield, Montreal, Quebec, Canada.
 1,344,028. Gasket for inflation-tube connections. A. A. Ewald, Oakfield, Wis.
 1,344,079. Rubber stamp attachment. F. E. Frost, Worcester, Mass.
 1,344,145. Carcass fabric for pneumatic tire. J. F. Palmer, Riverside, Ill.
 1,344,337. Cushion wheel. P. H. Dorsey, Elgin, La.
 1,344,346. Cushion tire. F. A. Krusemark, L. G. Funkhouser and H. G. Carpenter, assignors to K. F. & C. Tire & Rubber Corp.—all of Roanoke, Va.
 1,344,349. Open face gas mask. G. A. Mickelson, Vancouver, British Columbia, Canada.
 1,344,401. Pneumatic wheel with solid tire and pneumatic tube. E. B. Hudson, Middletown, Ohio.
 1,344,443. Attaching means for rubber heels. J. W. Denmead, Akron, Ohio.
 1,344,544. Cord fabric and rubber soles for boots or shoes, having ends of cords presented to wearing surface. J. E. Grosjean, Lima, assignor by direct and mesne assignments of one-fourth each to L. F. Montgomery, Fort Recovery, and F. L. Maire, Lima—all in Ohio. (See THE INDIA RUBBER WORLD, June 1, 1920, page 590.)

- 1,344,662. Demountable rim for tires. B. Tamburello, New York City.
 1,344,760. One-piece collapsible nursing bottle. W. E. Goddard, Watertown, Wis.
 1,344,773. Resilient tire. W. Seidel, Chicago, Ill.
 1,344,773. Tire valve. A. C. Berg, White Bear, Minn.
 1,344,854. Garment supporter. G. R. Bonchright, Grand Rapids, Mich.
 1,344,856. Ear drum protector. E. Baum, Philadelphia, Penn.
 1,344,935. Resilient heel tread with soft rubber plugs. R. Armour, Providence, R. I.
 1,344,986. Resilient wheel. A. H. Carlson, Butte City, Calif.
 1,344,990. Shock absorbing wheel with pneumatic hub. R. R. & A. Court Beedon, Simla, Punjab, British India.
 1,345,040. Hair curler with elastic band. O. E. Vandamark, Los Angeles, Calif.
 1,345,046. Heat insulating fabric. F. V. Wedlock, assignor to Featheredge Rubber Co.—both of Chicago, Ill.
 1,345,114. Cushion wheel. T. W. Arter, Bellaire, Ohio.
 1,345,228. Tire. G. D. Pearson, Montreal, Quebec, Canada.
 1,345,256. Elastic vehicle tire. W. E. Russell, Akron, Ohio.
 1,345,269. Demountable rim for tires. O. Smith, Springfield, Tenn.
 1,345,282. Demountable rim for tires. Victor R. Teague, Lovington, N. C.
 1,345,313. Demountable rim for tires. W. W. Bowman, New York City.
 1,345,332. Demountable rim for tires. M. Hollister, Jr., Fort Dodge, Iowa.

REISSUES.

- 14,900. Resilient wheel. W. A. Black, assignor to The Simplex Auto Wheel Co.—both of Spokane, Wash. (Original No. 1,277,537, dated September 3, 1918.)

THE DOMINION OF CANADA.

ISSUED JUNE 1, 1920.

- 200,462. Tire casing. H. E. Grabau, Long Island City, and A. C. Schwartz, New York City—both in N. Y., U. S. A.
 200,510. Vehicle tire with air reservoirs. O. J. Eisele, N. Y. C., U. S. A.
 200,538. Pneumatic reinforced tire. P. Huth, San Francisco, Calif., U. S. A.
 200,567. Reinforced pneumatic tire. H. L. Ochs, Kansas City, Mo., U. S. A.
 200,598. Ear stopper. B. T. Stair, Los Angeles, Calif., U. S. A. (See THE INDIA RUBBER WORLD, June 1, 1918, page 544.)
 200,637. Solid rubber tire. The Dunlop Rubber Co., Ltd., Westminster, County of London, assignee of G. Macbrien and H. C. Young, both of Birmingham, County of Warwick—all in England.
 200,644. Garter. The Kabo Corset Co., assignee of L. S. Florsheim—both of Chicago, Ill., U. S. A.

ISSUED JUNE 8, 1920.

- 200,780. Hat-pin protector connected with elastic band. J. B. Maserang, Belleville, Ill., U. S. A.
 200,862. Vehicle wheel. The Eagle Wheel & Tire Co., Inc., assignee of J. E. Harrigan—both of New York City. (See THE INDIA RUBBER WORLD, April 1, 1919, page 369, and December 1, 1919, page 155.) U. S. A.

ISSUED JUNE 15, 1920.

- 200,943. Repair cover for pneumatic tires. F. W. Farr, Northampton, England.
 201,018. Metal tire with pneumatic inner tube. J. L. A. Tetreault, Montreal, Quebec, Canada.
 201,028. Cushion wheel. G. Zinsli, Sentinel Butte, North Dakota, U. S. A.
 201,079. Milking machine test cup. The Ridd Co., Limited, assignee of Ambrose Ridd—both of New Plymouth, New Zealand.

ISSUED JUNE 22, 1920.

- 201,106. Composite rubber and fabric top for cycles and similar saddles. J. Jelley, Coventry and H. Jelley, Birmingham—both in England.
 201,184. Pneumatic rubber tire with air tight joints, etc. E. B. Killen, London, E. C. 4, England.
 201,191. Device for attaching nipples, caps, etc. W. P. Limacher, Pasadena, Calif., U. S. A.
 201,279. Endless belt. The Goodyear Tire & Rubber Co. of Canada, Limited, New Toronto, assignee of The Goodyear Tire & Rubber Co. of Canada, Toronto, assignee of A. M. Hardy, Bowmanville—all in Ontario, Canada.

ISSUED JUNE 29, 1920.

- 201,360. Spring tire. E. B. Esther, Missouri, U. S. A.
 201,401. Automobile wheel with metallic tread encased in rubber. G. W. Sell, Portland, Ore., U. S. A.

THE UNITED KINGDOM.

ISSUED JUNE 2, 1920.

- 140,971. Self-filling fountain pen. H. A. Widmer, 32 Clerkenwell Road, London.
 141,026. Tire valve. A. Schrader's Son, Inc., 783 Atlantic avenue, Brooklyn, New York, assignee of H. P. Kraft, 219 Godwin avenue, Ridgewood, New Jersey—both in U. S. A. (Not yet accepted.)
 141,071. Fountain pen. J. Mallat, 53 Boulevard de Strasbourg, Paris (Not yet accepted.)
 141,075. Fountain pen. J. Mallat, 53 Boulevard de Strasbourg, Paris. (Not yet accepted.)

Review of the Crude Rubber Market.

NEW YORK.

When first latex crépe was quoted on the spot at 30 cents during the last week of July, the low record was established for this standard grade. The absence of sellers and the lack of buying interest on the part of manufacturers were influential factors in the support of the market.

Conditions in the plantation rubber market during the past month have been generally quiet and prices steady although the tendency has been downward. There was a marked scarcity of sellers, and other than dealers' business, little buying has been done as the manufacturers evidently believe that the bottom has not been reached. In fact, several large buyers became September sellers as futures were out of all proportion to spot quotations.

Parás have kept company with plantations being ruled by the same market conditions, but prices are believed to have reached rock bottom.

Spot and future prices for plantation and South American rubber at the beginning and toward the end of the month are shown in the following quotations:

PLANTATIONS. July 1, first latex crépe, spot, 35 cents; July-September, 37 cents; October-December, 40¼ cents; January-June, 43½ cents.

July 26, first latex crépe, spot, 32 cents; July-September, 33½ cents; October-December, 37 cents; January-June 42¼ cents.

July 1, ribbed smoked sheets, spot, 35 cents; July-September, 36½ cents; October-December, 40¼ cents; January-June, 43¼ cents.

July 26, ribbed smoked sheets, spot, 31½ cents; July-September, 33¼ cents; October-December, 36¼ cents; January-June, 42 cents.

July 1, No. 1 amber crépe, spot, 38 cents.

July 26, No. 1 amber crépe, spot, 30 cents.

July 1, No. 1 rolled brown crépe, spot, 29 to 30 cents.

July 26, No. 1 rolled brown crépe, spot, 27½ cents.

SOUTH AMERICAN PARÁS AND CAUCHO. July 1, upriver fine, spot, 35 to 36 cents; islands fine, 37 cents; upriver coarse, 26 cents; islands coarse, 21 cents; Cameté coarse, 20¼; caucho ball 27 cents.

July 26, upriver fine, spot, 34½ cents; islands fine, 33 cents; upriver coarse, 23 cents; islands coarse, 20 cents; Cameté coarse, 19 cents; caucho ball, 21 to 24 cents.

NEW YORK QUOTATIONS.

Following are the New York spot quotations, for one year ago, one month ago, and July 26, the current date:

RECLAIMED RUBBER.

A healthy request for reclaims has been maintained during July, although transportation facilities continue poor and deliveries uncertain. The mechanical goods factories were somewhat less busy than a month ago and there is an appreciable slowing down in tire production, resulting in easier conditions and lower prices for certain grades of reclaimed rubber.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Myers, broker in crude rubber and commercial paper, No. 1 Liberty street, New York City, advises as follows:

"During July the demand for commercial paper has been very limited, and almost entirely from out-of-town banks, rates ruling at 8½ to 8½ per cent for the best rubber names, and even higher for those not so well known."

SINGAPORE RUBBER MARKET.

GUTHRIE & CO., LIMITED, Singapore, report [June 10, 1920]: Following advices of declining values in London and New York, the rubber auction opened yesterday to a considerably weaker market and prices of all grades show a substantial drop from last week. The highest paid for fine pale crepe was 76 1/2 cents (two special parcels sold at 77 cents), a decline of 5 1/2 cents, while ribbed smoked sheet fetched up to 77 cents (paid for a few lots only), being 4 1/2 cents down. Off quality sheet and crepe was difficult of sale and sellers had to make considerable sacrifices on these grades to meet the market. Brown and dark crepes were 6/8 cents down.

Demand was fairly good at the lower levels, but prices tended to sag during the course of the sale and the market closed distinctly weak with the prospect of a further decline.

Of 771 tons cataloged, 456 tons were sold.

The following is the course of values:

	In Singapore per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked, 76c	77c	1/11 1/2 @ 2/0
Sheet, good ribbed smoked, 75c	76c	1/8 @ 1/11 1/2
Crepe, fine pale, 76c	76 1/2	2/0 1/2 @ 2/0 3/8
Crepe, good pale, 65c	75 1/2	1/9 1/2 @ 2/0 1/8
Crepe, fine brown, 58c	66c	1/9 1/2 @ 1/9 1/8
Crepe, good brown, 48 1/2	57	1/4 1/2 @ 1/6 1/8
Crepe, dark, 41 1/2	54	1/2 1/2 @ 1/6
Crepe, bark, 40c	45 1/2	1/3 @ 1/3 3/8

*Quoted in Straits Settlements currency; \$1 = \$0.567 United States currency.

AMSTERDAM RUBBER MARKET.

JOOSTEN & JANSSEN, Amsterdam, report [July 9, 1920]: During the last week the market was firm, although interest was chiefly concentrated in First Qualities Hevea, whilst the lower grades found few or no buyers. Prices paid for Standard Qualities consequently improved from f. 1.16 to f. 1.20.

On the Terminal Market a large turn-over took place; July delivery improved from f. 1.14 1/2 to f. 1.20, December from f. 1.24 to f. 1.26, March from f. 1.27 1/2 to f. 1.32 1/2. The market closed easier, particularly for the further positions: July f. 1.20, October f. 1.22, December f. 1.25, March f. 1.29.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official report from Kuala Lumpur states that the exports of plantation rubber from the Federated Malay States for the month of May amounted to 7,627 tons, compared with 8,375 tons in April and 7,308 tons in the corresponding month last year. The total exports for five months in the current year were 40,426 tons, against 42,623 tons for the corresponding period last year and 35,396 tons in 1918. Appended are the comparative statistics:

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official report from Singapore states that the exports of plantation rubber from Straits Settlements ports in the month of May amounted to 6,617 tons (of which 2,788 tons were transshipments), against 15,720 tons in April and 15,845 tons in the corresponding month last year. The total shipments for the five months of the present year amount to 67,773 tons, compared with 77,666 tons last year and 35,665 tons in 1918. Appended are the comparative statistics:

The value of imports given is the c. i. f. value of imports in Brazil, and, of course, does not include any taxes or duties payable after arrival at a Brazilian port. The value of exports is f. o. b. at the respective port of clearance in Brazil, appraised in accordance with the prices current at such port on the weight or quantities, gross or net, as the case may be, of the merchandise declared in the respective manifest,

plus the cost of cartage, packing and loading charges and the export duties collected at the port of shipment. Freight and insurance being generally paid abroad are not included. The c. i. f. in which values are given is the paper mit reis (\$1), which during 1919 was on the average equivalent to \$0.26 American currency. A kilo = 2.2 pounds.

(Compiled by The Rubber Association of America, Inc.)

THE MARKET FOR RUBBER SCRAP. NEW YORK.

THERE has been practically no business in the rubber scrap market during the past month. With the exception of a few sales of tires, and an occasional inquiry for boots and shoes, the market has been dead.

The present weakness is primarily due to the low price of crude rubber and the general lack of rubber manufacturers' interest in raw material at this time. There is no apparent reason to look for improvement until fall, when the rubber mills are expected to resume operations on full time.

The following prices are unchanged since a month ago, and are nominal quotations:

QUOTATIONS FOR CARLOAD LOTS DELIVERED.

July 26, 1920.

Prices subject to change without notice.

THE MARKET FOR COTTON AND OTHER FABRICS. NEW YORK.

AMERICAN COTTON. New crop conditions continued to improve during the past month and the quotations for spot medium uplands steadily advanced from 38.75 cents on July 1 to 43.75 on July 24. Few sales were recorded, and the general market condition was quiet and steady with firm prices.

SEA ISLAND COTTON. Holders of Sea Island cotton are aware of their strong position and believe that average extra choice is worth about \$1.25. The small supply and high price of Sea Islands practically eliminates this material from the tire fabric situation.

ARIZONA COTTON. There has been no change in the market conditions of a month ago. Practically all the crop has been sold and the few bales remaining are worth about \$1.20 for average extra.

EGYPTIAN COTTON. The Egyptian market has shown some strength lately which does not seem warranted in view of the excellent new crop prospects. Cable advices state that this old crop is being manipulated by bull interests, and the demand is better than it has been for the last two months. High grade

Sakel is quoted about \$1.20; medium to low grades, \$1.10 prompt shipment; medium grades of uppers can be bought around 70 cents.

DUCKS AND DRILLS. The market has been listless, the firmness of the cotton market acting as a brake on price declines of cotton goods.

RAINCOAT FABRICS. Conditions in the raincoat fabric trade are practically the same as last month. There is little or no buying and prices have not changed.

SHEETING. The market is very quiet with little or no buying of sheetings that are rather weak with many soft spots. The mills have caught up on orders and are anxious for business but the trade is not showing a disposition to buy. Improved business is not looked for until October 1.

TIRE FABRICS. The demand for tire fabrics that has overtaxed the mills for many months has been somewhat relieved by the general slowing down of the tire manufacturing industry. Cord fabrics are in greater demand than building fabrics, due to the steady increase in cord tire manufacture. In fact, many mills are disposing of their heavy stocks of 17 1/4-ounce building fabric. Prices are slightly lower than last month and quotations are largely nominal.

NEW YORK QUOTATIONS.

July 26, 1920.

Prices subject to change without notice.

(Compiled by Davis, Benachi & Co.)

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

THERE has been much less congestion in freight transportation conditions during the past month and the situation will doubtless continue to improve. In practically all lines manufacturers find it impossible to satisfy the demands of their customers, although they are making strenuous efforts to do so. Prices generally have remained firm with a tendency to recede slightly here and there.

ANILINE OIL. Makers were behind in their deliveries early in the month with prices up to 35 cents. This was followed by a downward movement during the balance of the month till supplies were ample for the current demand and spot goods were selling at 32 to 33 cents.

BARYTES. Producers of barytes are strenuously endeavoring to overtake the demand upon their facilities. There has been little change in price noted. Quotations have held steadily at \$23.50 per ton with some tendency to rise.

BENZOL. The supply has continued light. Manufacturers are behind and trying to catch up. The situation has led to changes in prices extending over the month from 23 cents to 35 cents for the pure grade and from 28 cents to 33 cents for the 90 per cent grade.

Co. Building.

BLACKS. The market remains steady with prices unchanged.

CARBON-BISULPHIDE. Early in the month producers' stocks were cleaned out. Prices remained unchanged at 8½ cents under this condition.

CARBON-TETRACHLORIDE. The demand has held steady and fairly active. Prices have ranged from 10½ cents early in the month to 13 and 14 cents toward the latter part.

DRY COLORS. There has been a shortage of red oxides. The demand for dry colors in general has been steady, and prices unchanged.

LITHARGE. The situation is improving and the worst is said to be over as regards producing and shipping to meet the demand which continues to be very active. There will be no change in prices until a revision of the lead list takes place.

LITHOPONE. The old prices are announced to continue for the third quarter of the year. New plants and additions now under construction are rated to increase the lithopone output by 25,000 tons annually.

SUBLIMED LEAD. The demand for sublimed lead is active and deliveries are good with conditions of supply in eastern United States steadily improving. Prices hold at 10 to 10½ cents.

SULPHUR. The market is steady and prices unchanged.

WHITING. The war-time situation has not yet been eliminated. Few, if any, receipts of chalk are coming in and the demand exceeds the supply.

ZINC OXIDE. All the plants are operating to capacity and extensions are being rushed. It is reported that in 1915 there were two producing companies in the United States with four plants; now there are 17 such companies with 23 plants. The chief demand is from the paint and rubber manufacturing industries, both of which are active.

Vol. 62 SEPTEMBER 1, 1920 No. 6

SUBSCRIPTION: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**ASSURING THE CRUDE RUBBER SUPPLY.**

IT HAS BEEN WELL SAID that the nation which lacks vision must surely perish. With equal truth it may be said that no industry, however great, can afford to let success blind it to the need of looking well into the future and adequately planning to conserve the primary source of all its wealth, namely, that which yields its raw material and to which everything else must prove of secondary account.

The best informed are confident that the rubber industry will expand indefinitely and long be spared anything approximating a crisis; yet if its position is to be made impregnable, regard must be paid not merely to bettering its fiscal affairs, enhancing the efficiency of its processes, improving its processes, and increasing its output, but it must give greater attention than ever to the production of crude gum; not only by extending plantation areas, but also by taking every precaution to preclude the possibility of crop failure, a lessened yield, or latex quality deterioration, whether due to soil exhaustion, climatic changes, or plant diseases.

All this is but prefatory to hearty commendation of

an appeal which is being made to rubber manufacturers throughout the world by the Imperial College of Science and Technology, South Kensington, London, for the support of the Botanical Section of its Department of Biology, and which appeal has recently received vigorous indorsement and substantial support from the Council of the Rubber Growers' Association of England, alined with which are the owners of the largest rubber plantations in the world. These far-sighted business men keenly realize how such an institution can carry on much better than any they might establish among themselves, exhaustive research in rubber plant diseases, bio-chemical problems in utilizing tropical flora, bacteriology of soil, plant breeding, and allied subjects of pressing concern to growers and consumers of tropical produce. The British Government contributes generously to the cost of this practical scientific work, but the expense of maintaining such research, keeping up great laboratories, and training numerous students willing to devote their lives to the betterment of the rubber industry quite overtakes the resources of the famous college.

Apart from the fact that the question of improving rubber conditions at their source is of direct and pecuniary advantage to them, and that the college is ideally fitted for conducting research and worthy of most liberal encouragement, American manufacturers are in this instance afforded an opportunity to show their appreciation of unique and important consideration. Not only are they mindful of the valuable pioneer work of English rubber planters, and well do they realize that this country is greatly dependent upon English enterprise for its supply of raw rubber, and that in aiding the college named and cooperating with the rubber growers overseas they are but helping American industry, but they also do not forget that during the Great War, when production in this country in so many other lines was halted or retarded through inability to import raw material, the rubber manufacturers of the United States knew no shortage of material, having been directly favored with an abundant, unailing supply of crude gum sold to them at the low, pre-war prices, even though the cost of everything else was sky-rocketing.

NO SLUMP IN SIGHT.

THE MIDSUMMER DULLNESS, with its vacations, a few shut downs and a certain slackening in orders, in the light of the needs of the country does not for a moment argue a general depression in the rubber business. As the Goodrich company points out, the automobile and motor truck business is due to continue its demand for tires and that in increasing proportions. So, too, the United States Rubber Co. predicts a footwear business for next year fully 40 per cent greater than that of the present year. In addition to this is the

vast new railway equipment needed for railroads in all of which the mechanical goods companies share. Truly, instead of gloom, the prevalent attitude in rubber should be most optimistic.

PROFIT-SHARING, PIECE WORK AND BONUSES.

HARASSED with pleas for higher wages and shorter working time, and menaced with direct or covert threats of strikes, many a rubber concern, operating perhaps on a narrow margin of profit and against keen competition, is often sorely puzzled as to how best to placate discontented operatives. To raise the wage scale without being able to increase the selling price of the products, much less to reduce the working time while advancing the fixed pay, may mean flirting with failure. Finally, to the distracted concern casting about for a solution for the vexing problem the profit-sharing plan is suggested as a "happy compromise"; and the managers, like the drowning man who clutches even at a straw, seize upon the plan. If it be accepted by the employees the managers flatter themselves on their good fortune in thus composing the disgruntled and averting an impending disaster. Yet what they really do is to administer to themselves and their employees a Lethæan draught to make them for the time being forget their mutual troubles, while blindly trusting to the morrow to supply the deficiencies of the present day.

Because in some favorable instances the profit-sharing scheme has been a success, that does not alter the fact that it is unscientific and cannot be applied efficiently in a wide variety of cases. For a concern to virtually agree not only to maintain a certain scale of wages, but also to distribute regularly a generous share of profits to its employees, means assuming an obligation that is often very difficult to discharge. Unforeseen circumstances may make such profit smaller than the employees had been led to expect, or it may disappear altogether, arousing suspicion and ill-feeling among the workers. Setbacks come to even well-directed concerns; and statistics remind us that but one out of five business ventures proves a money-making enterprise. Hence, when the share of profit fails to materialize it may be hard to convince the disappointed workers that they have not been tricked. Stockholders, accustomed to business reverses, may resign themselves meekly to the passing or reduction of a dividend; but impractical employees, who waived their demand for more pay and accepted the will-o'-the-wisp of profit-sharing, may angrily renew their claims, and the last state of the temporizing employer may be worse than the first.

Even though some profits be declared, the ardor of the zealous, ambitious worker is sooner or later chilled by the indifference of the lazy or incompetent worker

who shares equally in the awards, and he either lapses into the humdrum of mediocrity or goes elsewhere to better himself. While the wage system will linger long with us, and while in some forms of employment it is neither feasible nor desirable to supplant it with any other form of compensation, yet for a great many industries a much more elastic system has been found advisable to add zest to work. Such procedure is to pay men for what they actually do in quantity and quality, and not a portion of profits that some one else may have won for them through good fortune or through rare managerial skill. A close approximation to this is seen in the piece-work system that obtains in some of the largest rubber factories in the country, and which mode of rewarding industry provides an unflinching incentive to speed up and increase production, while tending to disarm distrust and lessen friction between employer and employed.

The second largest steel producing concern in America, employing over 100,000 men, rejected the profit-sharing system as too vague and uncertain and installed the wage and premium plan instead with striking success. Not only are the workers assured of a fixed daily allowance, but they also receive a bonus for everything done beyond a specific minimum amount. No man is too high or too low to benefit by this plan; and even where a relatively small amount of manual labor enters into a task, a man gets extra compensation for what he saves in fuel or other commodities, or for devising time- and labor-saving processes. It means maintaining a very complete cost system, but the investment yields a good return. Best of all, it pleases the worker to be paid fairly and quickly for personal, individual service, and for every extra effort he puts forth, instead of having to wait a long time for possible "profits." Perhaps this is the reason why this concern did not have to close its mills for even a day during the big steel-workers' strike last fall.

HAS THE FIBER SOLE ENEMIES?

THERE IS NO QUESTION that the rubber fiber sole found many friends among the wearers of medium priced shoes. This for the very good reason that it outwore two or three leather soles. Complaint is beginning to be heard that it is not so easily obtainable as it was in the past, that retailers and repair men often do not now stock it. One suggested reason is that repairers do not desire their work to last too long. Another is that the leather sole men are quietly fighting the fiber sole as jeopardizing their business. It is probable that neither of these conditions prevails to any great extent. Furthermore, were such conditions prevalent, they would be, if merely taken advantage of, an ideal background for a big drive in fiber soles.

Possibilities of the Peachey Process.

IN CONSIDERING an invention that appears to be revolutionary it is interesting and always well to know the source. The inventor of the Peachey process, S. J. Peachey, is a well-known English chemist, who since 1902 has been lecturer in chemistry in the Manchester College of Technology and lecturer also in the faculty of technology of the University. For many years he has devoted much attention to rubber, has produced a number of valuable compounds and has done much toward the development of accelerators.

BRIEF OF THE PROCESS AND GASES.

The process, briefly, is the exposure of rubber compounded or pure in sheet form without sulphur, exposed first to sulphur dioxide gas, followed by exposure to hydrogen sulphide gas, all without heat; or saturation of rubber solution with the same gases. Sulphur dioxide, one of several oxides of sulphur, is a colorless gas resulting from the burning of sulphur. It was first obtained in the pure state and recognized by Priestley in 1775. It occurs in nature in the gas issuing from volcanoes and in solution in waters of some springs. Enormous quantities of sulphur dioxide are used in the manufacture of sulphuric acid by the combustion of sulphur or a metallic sulphide.

Sulphur dioxide is colorless and has the peculiar irritating odor observed when sulphur is burned. It is 2.2 times heavier than air and under standard conditions one volume of water dissolves about 80 volumes of the gas. It is easily liquefied, a freezing mixture of ice and salt being sufficient to effect condensation under atmospheric pressure. The resulting liquid is colorless and is a commercial product, being stored in strong glass syphon bottles or metal containers.

Hydrogen sulphide is a colorless gas of very offensive odor, familiar as the odor of rotten eggs. It is 1.18 times as heavy as air and may be readily condensed to a colorless liquid. One volume of water at ordinary temperature dissolves three volumes of the gas, which may be expelled completely by boiling. In pure form the gas acts as a violent poison and even when diluted largely with air produces headache, dizziness and nausea. Fortunately its extremely disagreeable odor gives warning of its presence. It is not an article of commerce but may readily be prepared by the action of hydrochloric acid on iron sulphide and may be stored in glass or metal containers.

PRECURSOR OF VULCANIZATION IMPROVEMENT.

No doubt the Peachey process is of value, of great value, but it is probably not the last word in this line of vulcanization. Just as aniline came into use as an accelerator and was later superseded by other better catalyzers, so will the dual gases be superseded by compounds, liquid, solid and gaseous, that will produce vulcanization within the rubber compound and be so graded and governed that exact time limits and varying results be accurately obtained. This is assured by the general interest in this line of work and the searching experiments that have long been carried on in many of the great rubber laboratories.

That curing by quick and high heats is often a detriment is freely conceded. Fabrics are certainly not improved; indeed certain of them are weakened. Animal substances like leather are burned unless specially prepared to withstand the heat and even then suffer a loss of original strength. Where the Peachey process is adaptable, therefore, fabrics and strengtheners of all sorts may be expected to preserve their original integrity.

The possibility of getting rid of chloride of sulphur and bisulphide of carbon will appeal to those who use the cold

cure. To be sure, through modern safeguards the ill effects of both the solvent and curative agent are guarded against, but neither are pleasant ingredients either in store or in use.

Of the claims to superiority in result some attract instant attention and some do not. The claim that porosity will be much lessened is doubtless sound, but with a very definite knowledge of the cause of porosity, both chemical and mechanical, the evil is rarely present. Anti-porous ingredients and the pressure cure make gas bubbles almost an impossibility even in the greenest of stocks.

ON THE RELATIVE IMPORTANCE OF COLORS.

The importance of color or shades of color in soft rubber goods is generally overestimated. In ninety-eight per cent of the manufactured product it is of absolutely no importance. A very little reflection will make it evident that pink belting, robin's-egg blue wire covering, old-rose valves, or Titian truck tires would be of no interest to users. Not only is this true in mechanical lines, but in footwear and clothing as well, where the bulk of the product will always be black by preference. Furthermore, in all of the important lines where reds, tans, blues or whites are demanded they are successfully produced at reasonable cost. In druggists' sundries and notions, as bathing caps, color, however, is of value. Ten years ago the announcement that any desired shade could be obtained in rubber would have interested manufacturers exceedingly. Today, however, so great a variety of colored compounds is produced that the actual necessity does not exist. This does not mean that other shades would not be used if available, but the void of past years no longer exists.

However, in light rubber surfaced clothing, particularly for ladies' wear, there seems to be a considerable field. In the past some beautiful effects in color have been obtained, but with difficulty. Peachey's process, however, would seem to open the door to the production of a great variety of colors, shades and effects rivaling the finest fabrics, and such as would appeal irresistibly to the decorative sex.

In toy balls also, solid colors in cheap compounds would obviate the necessity of painting the surfaces. It is quite probable further that balloon fabrics colored to resist the effect of sunlight might be more effective than under existing methods.

In the cases of dipped goods and spreader goods when cured by acid or vapor, manufacturers may and doubtless will find in the new process a surer way of securing a greater variety of colors than at present and it is in those lines that a considerable development is probable.

An advantage would seem to lie in the complete vulcanization that the process insures, something that neither the hot process nor the sulphur chloride cure accomplishes. Another is the freedom from efflorescence of sulphur (bloom) on the surface of finished goods.

CURING METHODS CONJECTURED.

Just how one would cure rubber goods by the Peachey process is a very interesting subject upon which to speculate. In spreader work, for example, the gas impregnated compound would be applied as usual. The first coat as soon as the solvent was evaporated would, unless we err, at once cure itself. The second coat would therefore be spread upon a coating already vulcanized. Not that this would matter probably, but it is a bit startling. Or the goods could be spread with the ordinary compound minus the sulphur and exposed to the action of the gases in an ordinary dry heater,

without the heat, however. This naturally brings up the question as to whether all dry heat goods can be thus treated, carriage cloth, clothing, blankets and the like, and the answer sounds like yes.

Still considering dry heat processes, may boots and shoes be thus cured? Granting that the new process brings about a very dense condition in the finished product, is the result likely to be as good as that obtained by the pressure cure now generally used in footwear manufacture? If so, are the big old-time dry heaters, minus their heating equipment, likely to come into vogue again? The question of finish, of course, will be important. Footwear is a varnished product and it is likely that a coating of boiled oil varnish on the outside of a shoe would keep the sulphur gases out. That, however, is not important, as a Peachey process varnish could doubtless be added that would be more elastic and brilliant than one made of linseed oil.

TOUCHING NEW COMPOUNDING INGREDIENTS.

It is in the line of new applications of rubber and its wider use of new compounding ingredients, however, that one is minded to investigate.

The fact that the process is one that is free from the destructive influence of heat opens up many new compounding possibilities. Organic substances have been used with difficulty in rubber compounding in the past. Today, glue is about the only one that is largely used, and that took much careful experimentation before it was a success. The right kind of cold process, however, would admit the use of almost any kind of gelatin, animal or vegetable, of which the seaweed gelatines are the most interesting. There is also the possibility of the incorporation of such animal products as dried milk and casein. Indeed the utilization of almost any kind of dried animal refuse would seem to be feasible. Although the gases in themselves are not particularly pleasant, the process would seem to admit of the use of a great variety of essential oils and perfumes that would not only do away with the smell of the vulcanizing ingredients but would impart a pleasant odor heretofore difficult to obtain in manufactured rubber goods. As a case in point, Chinese rubber shoes with a distinct odor of sandal wood would doubtless find a ready market in the Flowery Kingdom.

ON THE USE OF VARIOUS PRODUCTS.

There is also an opening for the utilization of a variety of vegetable fibers not heretofore used because injured by heat. Thus there would be nothing to prevent the use of wool shoddy, bristles, horsehair or cowhair.

Speaking of vegetable products, the flours of rice, barley, rye, oats and wheat, once the prices come down, might make good compounds. Indeed a very little of the cold process rubber added to the macaroni compound would produce white tubing comparable to some of that which today appears in the open market.

The inventor has already mentioned the field now occupied by the products known as linoleums. There is no doubt that rubber as a binding material is infinitely superior to oxidized linseed oil. If in addition it is self-vulcanizing, the product that should be produced would be much more durable and at much less cost. Furthermore, the same conditions should apply to table and shelf oilcloth.

It is in the line of repairs, particularly in rubber factories, that some such process should have its first development. In spite of constant inspection, goods that are defective are often scrapped. This is largely because they will not stand revulcanization without burning. A filler that will thoroughly vulcanize applied to a damaged section would, therefore, be of the greatest value. So too in the line of general repairs of all sorts. Such a jelly would find a very general use.

RUBBER GLUE POSSIBLE.

It is a well-known fact that the leather shoe manufacturers are very large users of rubber cements. These cements are used more for their waterproofing qualities than for holding. A channel cement that would be self-vulcanizing and thus add to the strength of the shoe would be a step in advance.

The glues, animal and fish, have long been in a class by themselves as adhesives and for sizing. A rubber cement that is self-vulcanizing is likely to find a field that will seriously crowd glue. In holding veneers, in book-binding, in many lines where waterproof qualities and a degree of elasticity are of value, rubber glue should be far superior to the organic product.

POSSIBILITIES OF COLD PROCESS HARD RUBBER.

There is no suggestion that the Peachey process produces hard rubber. On the other hand, with the investigations and experiments that are toward a self-vulcanizing compound that turns itself into ebonite will one day appear. When it does it will occupy a large part of the field now held by such products as celluloid and galalith. Accustomed as we are to only two or three colors in vulcanite, it is difficult to appreciate the tremendous field for hard rubber goods once they can be made in all colors and shades without overloading with detrimental pigments. Sufficient to say that a cold process like Peachey's applied successfully to hard rubber would produce ornaments in jade, amber, tortoise shell and the like, infinitely superior to any celluloid or casein products. While in lacquers, elastic varnishes and japan, rubber would have the field all to itself.

The possibility of a pure white hard or semi-hard rubber leads the thought at once to pottery. The fragile plates, cups and saucers are a constant source of trouble and expense, particularly in hotels and on shipboard. The cost of breakage alone is very great. A semi-hard white, odorless and strong dish would be a boon and it is not an impossibility.

We are minded here to speak again of hard rubber wood, the production of which would be immensely hastened by cold process vulcanization. Hard rubber wood is coming anyway and fortunately is not dependent on revolutionary processes.

Vulcanized fiber is a product that is very important in the arts, large factories being employed in producing it. The one troublesome quality of the material is that it absorbs moisture. To counteract this it is shellacked and surface treated. An analogous product containing a very little self-vulcanizing rubber would doubtless drive the old time fiber out of this market.

SUGGESTS RUBBER IN PAPER MAKING.

Rubber has in times past been tried in paper manufacture. Its high cost and the necessity for hot vulcanization rendered it of no value, however. Today, with cheap rubber and a cold process that does not injure fiber nor discolor, there are possibilities of rubber as a pulp binder finding a new and wider field of usefulness. It is likely also that many fibers heretofore useless might become valuable. Paper makers say that paper that crackles is not looked upon with favor and is unsalable. Possibly a little rubber in the harsh pulp might correct this evil. However this may be, a certain amount of rubber would greatly strengthen any paper; a sufficient portion would render it not only tough, but waterproof as well. And this applies not only to book and wrapping papers, but to wall papers and tapestries.

Furthermore, paper boxes, bottles, containers and cartons, cigar boxes, paper plates and scores of other paper products are likely to be made more sanitary and useful by this binder. It is also entirely possible that the Peachey process may be the necessary touch to make German paper clothing a success. Even today hundreds of Englishmen are wearing

German paper suits. The suits wear about a week. A rubber binder that in no way affects the color, that makes the product practically waterproof and more flexible, may bring the product into permanent competition with cotton, wool and silk wearing apparel. And speaking of silk, is not this addition just what is needed to bring artificial silk a bit closer in lasting quality to nature's product?

IMPROVED RUBBER THREAD.

Among the lines of manufacture that suggest themselves as being revolutionized by this or an analogous process one might cite rubber thread. This product as made today shows a square end in cross-section. A stretched rubber thread when it begins to give away shows a multitude of tears along the sharp edges. A round thread would not be open to this objection. Harking back to the beginnings of rubber thread, it was once made round by forcing rubber in solution through metal dies. Had the rubber dough been self-vulcanizing it is doubtful if the square thread ever would have appeared.

THE QUESTION OF MASS VULCANIZATION.

The possibility of making molded goods by this process is already engaging considerable attention. For these articles molds or forms of almost any material could be used, plaster of Paris, for example. It is likely that molds of porous material might find use. These have already been suggested by the inventor. For thick articles, however, they would hardly do. The reason is that in the vulcanization by mass there must be opportunity for the liquids to escape. It would be much like coagulation of rubber latex. If done in mass, water is imprisoned and unless sheeted it is held in the interior. In the same way a mass of rubber vulcanized by the Peachey process would inevitably contain water, and if solvent was used, much of it would be imprisoned. As to porous molds carrying this off, when earthen plates were tried for coagulating latex only the surface moisture was absorbed.

The statement is made that buffers (springs) may be made in layers, each vulcanizing itself in turn, adhesion between the layers being obtained by Peachey process cement. This is possible, and it is also possible that solid tires may be made by a similar building up process.

THE UNKNOWN EFFECT ON RECLAIMS.

A question of considerable moment upon which no light is yet thrown, is the behavior of the new process toward reclaimed rubber. So far no one seems to know just what results will be obtained, particularly in the medium and lower grades of reclaim. As fully as many pounds of recovered rubber are used as of crude, it is naturally one of the first of the queries that manufacturers put.

RUBBER MEN WILL DISCUSS SAFETY PROBLEMS.

The Rubber Section of the National Safety Council will consider safety problems of especial interest to the industry at a section conference to be held September 29 to October 1, in connection with the national session of the Council to be held at Chicago.

Among the topics for discussion will be: "The Present and Future of Safety in the Rubber Industry," chairman, S. M. Schott, United States Tire Co.; "Health Hazards," J. H. Horan, Hood Rubber Co.; "Making Mills and Calenders Safe," C. B. Mutchella, The B. F. Goodrich Co.; "Handling Materials," F. B. Martens, Firestone Tire & Rubber Co.; "Vulcanizing Apparatus," F. Scott, Hamlin & Co.; "Industrial Sanitation," W. N. Fitch, The B. F. Goodrich Co.; and "Teaching Safety in the Factories," H. T. Martin, The Fisk Rubber Co. An address will be made by J. N. Gunn, president of the United States Tire Co., on the opening day of the section meeting, and by A. Frank, factory manager of the Federal Rubber Co., on the last day.

EXPORTS OF INDIA RUBBER MANUFACTURES FROM THE UNITED STATES DURING THE CALENDAR YEAR 1919.

THE ANNOUNCEMENT of the United States Government that henceforth all tables of import and export statistics shall be for the calendar instead of the fiscal year ending June 30 as heretofore seems to be a step in the right direction. At any rate, it greatly clarifies such tables and permits a much simpler analysis and comparison for the layman, to whom "double-barrelled" year numerals like 1916-17 or 1917-18 were often a source of confusion.

Of much interest is the recently published table of exports of India rubber manufactures from the United States during the calendar year 1919, printed elsewhere in this issue. The total value, \$53,865,655, as against \$31,501,292 in the calendar year 1918 is proof positive to the rubber manufacturer that business is "picking up." Any business that nearly doubles itself in the space of a year is a good one to be engaged in. A comparison of the 1919 figures with the small export of \$12,441,220 during the year before the war (1913-1914) shows the progress made by the rubber industry of the United States in foreign markets.

By countries the report is just as encouraging. The exports of automobile tires rose to \$28,924,659 (more than half of the total rubber exports, by the way) as against \$14,511,621 for the calendar year 1918. Of these, \$11,907,480 went to Europe; \$2,970,464 to Asia; \$4,986,024 to our neighbor South America; \$3,872,374 to Oceania and Africa; while \$5,188,317 stayed near home, being exported to other places in North America. Cuba took \$2,013,071, while Canada called for \$1,021,014. Of tire exports to South America Argentina leads with \$1,788,147, with Brazil second at \$1,018,055. France took nearly a third of the tire exports to Europe, \$3,535,178; England bought \$1,508,460; Sweden, \$1,373,847, and Denmark, \$1,254,324, with the Netherlands not far behind at \$1,043,981.

Exports of tires to the Philippines totaled \$1,372,544, while New Zealand took \$1,023,807. The largest consumer of American tires in Asia during 1919 was the Dutch East Indies with \$686,873, while British South Africa led that continent with \$479,934.

The rubber shoe export rose from \$1,584,747 in the calendar year 1918 to \$4,551,386 in 1919, while rubber boots showed a decided fall—from \$2,799,116 in 1918 to \$714,713 in 1919. This is explained by the large exports to Europe where boots were needed during the war, while shoes are now in demand.

Exports of belting, hose and packing showed a considerable increase from the previous year, the amount in 1919 being \$6,100,460 as against \$4,525,243 in 1918.

Druggists' rubber sundries, which were not specifically reported before 1917-18, showed a gratifying increase; while in 1918 the figures were \$772,539, the amount nearly doubled the following year, being \$1,270,506 for the calendar year 1919.

Rubber scrap exportations increased very largely over the preceding year, the figures being \$808,993 in 1919 and \$287,883 in 1918. Reclaimed rubber also showed an increase, from \$502,176 in 1918 to \$839,938 in 1919.

COLLAPSIBLE PLAYING BALL.

A collapsible playing ball is a novelty on the market. Made entirely of cemented rubber, it may be inflated by blowing through the specially constructed aortic valve. As soon as the action ceases, the pressure inside causes a perfect automatic closure of the valve. When the player has finished, he inserts a rod or pencil, thus opening the valve and allowing the air to rush out. The empty ball may then be folded in any suitable manner, and carried without being in the way. (French patent No. 138,306. Bognier & Burnet, 21-23 rue des Filles du Calvaire, Paris.)

Tire Bead Manufacture.

By Robert C. Kelley, A. B.

It is an old axiom among rubber men that their merchandise is only as good as its weakest part; thus, the tiny pin-hole makes the whole inner tube useless, and the started sole makes the rubber shoe a second. This is particularly true of the automobile tire—a tough tread with a good non-skid design, the best Sea Island cotton frictioned with 95 per cent Pará, and a strong side wall will not give the mileage if the bead construction is faulty.

Bead making, while not involving any complicated processes or highly skilled workmanship, is nevertheless of enough importance to warrant a separate department for this work. Beads are divided into two classes, the straight-side bead and the clincher bead for demountable rims.

MAKING STRAIGHT-SIDE BEADS.

The straight-side bead is built up on a wheel the size of the tire, as here illustrated. This makes it necessary to have as part of the equipment a wheel which can be used interchangeably on the bead making machine for each size of tire. This wheel has the outer edge raised, forming a groove in which the bead is constructed in the following manner: first, a strip of frictioned cloth

about two or three inches wide, cut on the bias, is laid in the groove and stitched down with a plain hand stitcher or revolving wheel. Then several coats of cement are applied with a brush, and the strands of wire placed in the strip, twice around the wheel. On top of this as a covering are laid two plies of bead cord which comes in strips similar to cord fabric only of smaller staple cotton. The parts are then rolled together firmly by pressure of a hand roller on the revolving wheel.

The final operation before curing is to fold over the plies of fabric, completely covering the wire which is embedded in the center of the fabric. Great care must be taken to see that the wire is covered at all points, otherwise it will break through in the cure and spoil the bead. Spoiled or damaged beads are a total loss, as their hard, brittle texture and the presence of the wire make them valueless for reclaiming

purposes. In tire reclaiming one of the first operations is to cut out the bead.

The bead is cured in a circular mold in a hydraulic press for about seven to ten minutes and comes out in the form of a hoop. The overflow is trimmed off on a trimming machine, shown in the picture, and the beads are then inspected for breaks and defects due to faulty stock, poor making, curing, or trimming. Before passing to the tire maker the beads are dipped in a vat of specially prepared cement and hung on racks to dry, as here illustrated. This is to give the bead plenty of adhesion so that it will stick well to the plies of

fabric which encompass it in the tire.

The bead now passes to the tire maker and is built into the tire as follows: the maker first places the iron core on his machine and starts the first ply of building fabric on the core in such a manner that it entirely covers it, the center line of ply following the center line of the core, allowing it to overlap the core evenly on both sides and applied with equal tension. He next manipulates the two mechanical stitchers, bending the plies in to the under side of the core, forming ears in which the bead is placed within iron rings, which

BEAD MAKING IS OF SUFFICIENT IMPORTANCE TO REQUIRE A SEPARATE DEPARTMENT.

are held in place by clamps. The picture shows a tire-maker placing the bead for a straight-side tire. The bead in position, the rings are removed and the bead thoroughly stitched down to secure proper and uniform adhesion. The bead is covered by a piece of friction known as the bead ply or reinforcement and encompassed by additional plies of fabric.

MAKING CLINCHER BEADS.

The clincher bead differs from the straight-side bead in that it has a core of hard rubber instead of wire and is more nearly circular in shape, whereas the straight-side bead is like a triangle with sharp edges. This core is mixed and compounded with a high percentage of sulphur to make it vulcanize hard.

The stock is warmed up and run either on an outsole calender with a roll specially engraved for this purpose or on a tubing machine. These long strips of uncured bead gum

are first covered with a strip of friction, or, if uncovered, are buffed on a wire wheel to smooth off the rough edges, and placed in a spiral vulcanizing mold which is washed with liquid soap to prevent sticking to the mold. The cure varies from seven to ten minutes. The long strip is then removed from the mold and cut into lengths to make the size of bead desired. This must be carefully planned out before the beading is cured to avoid the waste of trimming, as the uncured trimmings can be used over again, whereas the cured ends have little scrap value. The ends of the bead are joined by splicing. This is done either in the bead department or by the tire-maker.

A clincher bead being buffed is shown herewith. Clincher beads are more flexible than straight-side beads, although they harden up in the second cure with the tire. The difference between the two types is seen in the illustration, where straight-side beads are hanging on the left-hand racks and clincher beads on the right, after dipping.

While methods differ in various plants, this article describes the processes of bead making generally followed in the tire industry today.

WATER REQUIREMENTS FOR RUBBER MILLS.

By Walter J. Bitterlich.

IN THE MANUFACTURE of rubber products, temperatures are of prime importance. Rapid changes as well as uniform and even temperatures are required and obtained largely by the use of water, steam, and air. Uniform temperatures cannot be maintained with water, or air unless they are circulated. This is apparent while in bathing, when different currents are met with, some cold and some warm; also in a bath tub when the water is too cold and hot water is added, it is necessary to stir it up in order to make it uniform.

Owing to the tremendous amount of water used, economy is practiced by its reuse and the equipment requiring cold and warm water should be laid out, graphically, as follows:

GRAPH SHOWING WATER INSTALLATION FOR MILLS AND CALENDERS.

The above illustration shows how water economy can be accomplished, but no attempt has been made to show pumping arrangement because each plant has different conditions and the system should be designed for the conditions as they exist.

The amount of water used daily in rubber plants varies from 100,000 to 3,000,000 gallons per day, depending on the capacity of the mill. When water rates are low, its reuse is not always worth the investment in pumping and pressure tank equipment, but where water costs from 75 cents to \$1 per 1,000 cubic feet, the investment is saved in a very short time. If artesian wells are not available with cold water below 60 degrees F., the municipal supply is used, and this varies in the summer months from 70 degrees to 75 degrees F. Then it is necessary to increase the

velocity of the water to obtain quick changes in temperatures of mill and calender rolls, and consequently more water is used. Its reuse in this event should be given consideration, otherwise the water bill will be high.

In laying out the local water and steam supply for both the mills and calenders, the returns should always flow by gravity and not discharge up to the ceiling of the room. The reason for the former is because a roll will never be more than half full of water after the valve is closed and when a quick change to warm up the roll is necessary, only a half roll of water will have to be discharged, whereas, if return is up, a full roll will have to be discharged and double the amount of steam will be required to accomplish it.

Not only is there economy in gravity flow but more important is the uniform temperature that can be maintained on the surface of the calender or mill roll because when the roll has become hot and is full of water it is desired to cool it during shutdown by circulating cold water, the upper half of the roll will be warm and the lower half cold. This is because the cooling water entering and returning through the pipe in the center of the roll short circuits and the hot water remains at the top of the roll.

A method of conserving the water supply in mills, which, by the way, use the greatest amount, is to install an open funnel at the return pipe of the mill roll. It will show at a glance the amount of water flowing through the roll, and if one mill is using more than another, it may be seen by the foreman who can order the valve regulated for its economical use. Of course, some stocks require lower roll temperatures and consequently more water, but the foreman should know this and be able to save much water.

WESTERN SALES MANAGER, C. KENYON CO., INC.

OSBORNE SMITH TWEEDY, who has been appointed western sales manager for the C. Kenyon Co., Inc., Brooklyn, New York, with headquarters at 223 West Jackson boulevard, Chicago, Illinois, was born in Buffalo, New York, in 1872.

O. S. TWEEDY.

Following his education in the grammar and high schools of that city he started in business in 1896 with the Eagle Iron Works. In 1888 he was appointed Buffalo branch manager for the Revere Rubber Co., following which he joined the Diamond Rubber Co. organization for a period of ten years, first in the credit department at Akron, and later as Chicago district manager. He then went to the Federal Rubber Co., Milwaukee, Wisconsin, as general sales manager, after two years going to the Continental Caoutchouc Co. in a similar capacity, and on its absorption by the United States Tire Co. was appointed assistant general sales manager of the latter company, followed in 1916 by promotion to general branch sales manager, from which office he resigned to join the Kenyon forces. He is also vice-president of the Dryden Rubber Co., Chicago.

This experience in tire merchandising, covering more than twenty years, and an extensive acquaintance in the trade, should be an invaluable asset in introducing Kenyon cord tires and tubes to the Middle West.

Mr. Tweedy is a member of various Masonic bodies, B. P. O. Elks, Chicago, Detroit and New York Athletic clubs, Siwanoy Country Club, Lambs' Club, and International Sporting Club.

Will Rubber Soles Successfully Replace Leather Soles?

A Discussion of Rubber and Fiberized Soles from New as Well as Old Angles.

By Chester C. Burnham.

MORE AND MORE am I convinced that the day is approaching when a material composed mainly of rubber and some fiber is going to be in quite general demand for the soles of shoes. Rubber manufacturers have made remarkable progress in the manufacture of fiberized soles during the past five years and it is interesting to note that progress and success seems to have been greatest with those who have studied the problems of product and market in the most thorough manner.

There is a profound need for intensive study of the subject of fiberized soles. It is a fact, which even a slight investigation will substantiate, that much of the "grief" experienced by early promoters of so-called "substitutes for leather" was brought upon themselves by an appalling lack of knowledge concerning the uses of the product they marketed. Millions of dollars for mold equipment and advertising were thrown away in a short time through snap judgments and short-sighted policies.

During the war, when sole leather prices went sky high, the fiber sole should have come into its own. By that, I mean to

It is no wonder then, that purchasers often wished for some sort of a rubber sole that would at least last the season through and in addition, furnish a clinging, flexible and waterproof sole the while. It must not be forgotten that this vacation footwear was exceedingly popular with many people as was attested by the enormous sales in spite of unreasonable wearing qualities. It was common for a shoe clerk to suggest to a complaining customer, the advisability of resoling the shoes with leather, although the shoes may not have been a month out of that store and invariably, such shoes were sold without a guaranty for reasonable wear of the soles.

With rubber soles possessing many known deficiencies and yet with an unlimited market in sight and only awaiting development, it is strange that the rubber manufacturers did not pay more heed to improving their products. That there was need for improvement is shown by the accompanying diagrams and even these changes were not thought desirable until after the appearance of fiberized soles. Had the fiberized product not been thought of, it is possible that we might yet be trying to market the old style soles and with the same lack of attention to the requirements of the trade.

But with the introduction of these new products, new uses were found for them and in responding to these new uses a closer study of the use and abuse of soles in the manufacturing as well as in the wearing of shoes was made.

Over night, as it were, rubber manufacturers came to realize that their rubber soles had offered many perplexing problems to the shoe manufacturer because of their varied mold styles. The early style molds resembled the dotted line diagram in Fig. 1, while the standard pattern which soon came into general use, resembled more closely the solid line pattern shown in the same figure. The soles had to be "rough-rounded" or rough trimmed, anyhow, and whereas there might be a slight waste in some patterns the waste was more than offset by the time saved in shifting molds in the press room, by the gain in production and by the ease for all parties to handle their stock room problems.

STANDARDIZED PATTERNS AND IMPROVED MOLDS.

The standardized patterns popularized themselves so quickly that no one thought to improve them further and thus other defects passed into the new mold equipment without notice. It had been thought necessary to have a sharp bevel or pitch to the breast of the sole at the point where the forepart thinned out into the shank. The thread on the sole stitching machines often broke when the machine presser foot came to these sharp rises or when it jumped off into space, and at other times the thread tension increased so suddenly that the soles were entirely cut through as one cuts cheese with a thread.

The first attempt to correct this trouble was in the line of lengthening this bevel. This was better, but trouble was still experienced when the presser-foot of the sole-stitching machine tried to climb up this pitch on one side and down on the other. No very satisfactory results were obtained until some one hit on the idea of making the "fadeaway" or undulating shank. With this type, the presser-foot gained and lost the tension gradually and allowed the automatic thread-controlling tension devices to operate properly.

Even with this improved mold the troubles were not ended, for it was soon found that when soles with heavy foreparts were attached to certain types of shoes, the shanks were often not heavy enough to stand the strain of the stitching and wearing

FIG. 1

DOTTED LINES SHOW OLD PATTERN.

SHOWING OLD STYLE BEVEL SHANK TYPE OF SOLE.

FIG. 3

SHOWING VARIOUS STAGES OF SHANK DEVELOPMENT IN MOLD DESIGN.

say that economic conditions at that time were decidedly favorable to its introduction and sale in a large way. Unfortunately, obstacles were encountered, and in overcoming them at the start much was done to improve the product, but the expected heavy demands were not realized. How long it may take to regain this lost advantage is uncertain, but with the cattle supply of the entire world decreasing and with our domestic production of hides for sole leather falling off in an alarming manner, there is no question about there being a place for all the leather we can produce and also for a vast quantity of satisfactory fiberized rubber soles.

DEFECTS OF EARLY TYPES.

It is not difficult to recall the very earliest rubber soles that were manufactured. Some of us may not be altogether proud of them now, but we are prepared to admit that they were nearly all heavy, poorly designed for shoe factory manipulation and often composed of very little rubber and very many adulterants. Some you recall, had a very pungent odor which penetrated the insoles of the shoes and even the hose of the wearer and made frequent foot baths necessary. Be that as it may, their sale was large and on a type of foot-wear classified as "vacation shoes." Purchasers of this sort of footwear honestly expected the soles to crack across the ball or break away at the toe stitching long before the soles were worn through and often before the end of a short vacation season.

processes, and gave away. So once more new molds were designed, with the result that, now, nearly standard types are found in use among the most successful manufacturers.

Shapes.	Foreparts.	Shanks.
Men's	12 iron and 10 1/2 iron	7 iron
Boys'	12 iron and 10 1/2 iron	7 iron
Men's	14 iron	9 iron
Women's	9 iron	7 iron
Misses'	(An iron is equivalent to 1 1/4-inch.)	
Child's		

In Fig. 3 we show a rough idea of these various shank changes in sketches *a, b, and c*, while in *d* and *e* we show the spring heel mold in the old and new designs. The reader can easily imagine how great was the improvement in this particular case. Some shoe manufacturers wanted spring-heel soles with varied heights of heels and thus we soon found on the market heels as high as 3/4-inch. This necessitated the plying up of the heel portion of the blank used to fill the mold. It was later found much more practicable to make all spring-heel soles with heels 1/2-inch in height and then have the shoe manufacturer insert a wedge lift underneath the heel portion of the sole during the process of manufacture.

EFFECT OF POOR COMPOUNDS.

If rubber manufacturers were slow to improve their old molds and compounds, they were not so slow when it came to realizing the possibilities in the new fiberized product and in a short time there was not enough fiber of the proper kind obtainable nor were there sufficient fiberizing machines available to supply the demand for this material. In the crying need of the hour, with many fearing they would be outclassed by competitors, they were not so particular about the kind of fiber they got so long as they got it quickly and in sufficient quantities to enable them to flood the market with their products. Thus it came about that soles were soon on the market whose fibrous content might once have been leather refuse, hemp or jute rope, cork shavings and even grape packing, cotton waste, waste tire duck, silk fiber waste and even paper pulp—anything that could be reduced to a fibrous state quickly.

Of these over-night discoveries and compounds, some were remarkably good, while the vast majority of them reached an early grave. It was immediately recognized that the use of fiber in the soles gave them a much better bonding compound and stitchers in shoe factories found that they could now apply these soles in quantities without cutting the soles through in the stitching process. The fact that these fiberized soles were much lighter in weight was not overlooked and these facts together with their being better adapted to shoe-factory processes, led many to predict that they would soon replace leather.

These favorable points having been brought out through advertisements and trade press comment, the rubber manufacturers rushed to get their new compounds on the market, giving much time to quantity production problems but less attention to the needs of the shoe industry. This lack of diagnosis could but lead to unsatisfactory results and when these new products appeared from various makers they were of varied shapes, colors and thicknesses and not at all in conformity with the needs of the shoe manufacturers. Thousands and thousands of dollars that had hurriedly been invested in additional equipment for molds was wasted and more new equipment was necessary before the soles were fit for the market.

All this happened just prior to our entry into the great conflict and to give some idea of the demand for these soles at that time, it was reported that one large manufacturer was 400,000 pairs short of sales in September, 1915, and this in spite of a daily production of approximately 10,000 pairs. In six months his unfilled orders had almost reached the million pair mark and this in spite of increased production to about 17,000 pairs daily. But the war was on and sole leather had sky-rocketed in price. An economizing public was ready to substitute for leather and it was not long after this that the unfilled orders

of this same concern reached a goodly total of nearly 2,000,000 pairs. This is only one case and might be duplicated by several other large firms and imitated in lesser volume by many smaller firms.

AN IMPERFECT PRODUCT.

With all this apparent prosperity for manufacturers of fiberized soles and with the public acceptance practically assured, one hardly reckoned with the rude awakening that all were to get when it was found that many of the compounds failed to withstand the tests of time and every-day usage. Thousands of pairs of shoes were returned to the retailer—to the jobber—to the shoe manufacturer, because they failed in service. Other thousands which had not been applied to shoes were returned from the shoe factories to the rubber manufacturers. Realizing that rubber soles of the previous type had not always given serviceable wear, and anxious to put their new products "across" on the market, many enterprising sales managers had conceived the happy idea of guaranteeing their soles for wear, believing that this guaranty would decrease the sales resistance and make the product more acceptable with the consumer. Had they been sure of their product, all might have been well, but many tempted fate and the poorer compounds came rushing back by fast express and slow freight.

Very likely this was the best thing that could have happened, although it seemed at that time like a near calamity. Through all the disappointment, one fact sticks out clearly, however, and serves as indisputable proof that the process of rubber sole manufacture had undergone a change—a sufficient number of these new-born soles gave extraordinary wear and demonstrated that fiberized soles were extremely practical and worthy of further development.

THE NECESSITY OF IMPROVED COMPOUNDS AND METHODS.

With this fact pasted in their hats, a number of rubber chemists set to work and revised their formulas while others in the manufacturing line set about to study the varied needs of the shoe manufacturers. In this work they were aided by a prominent shoe machinery company, who are directly responsible for important changes in machines and parts used in the application and working of these soles on footwear.

It was learned that the tendency of rubber soles to stretch in wear must in some manner be greatly lessened and reduced to a minimum. Certain rubber ingredients were discarded as injurious to keeping qualities because investigation showed that soles were not often used as soon as received by the shoe manufacturer. Often they laid in the stock room for weeks and even if applied to shoes, the shoes might lie on the retailer's shelf for a season or more before finding an ultimate purchaser. In this way it was estimated that a proper sole should have keeping qualities for at least two years in addition to having wearing service after that time.

A large percentage of soles already marketed, trade-marked as well as unbranded, were unable to pass this test and realizing this, their makers dumped upon the market hundreds of thousands of pairs at a price said to average around 10 cents per pair and without removing or defacing the brands. Naturally this resulted in some of these soles being worn by the unsuspecting public and thus they were easily turned against a product that had not lived up to its advertised goodness and they promptly classified all such soles as unworthy of their patronage.

Such practices were not calculated to inspire confidence in the public mind and more especially at a time when every effort should have been made to restrict the circulation of undesirable merchandise. In fact, these failures threw a chill around the good as well as the bad soles with the result that a number of nationally known firms discontinued their lines and others who were about to launch a new product upon the market, profited by these experiences and indefinitely postponed its production.

ANNUAL REQUIREMENTS TWO HUNDRED MILLION PAIRS.

From the latest shoe manufacturers' directory we learn that there are about 1,000 manufacturers of shoes with a rated daily output of approximately 2,059,400 pairs of shoes. This total includes shoes of all kinds, many of which are not adapted for the use of fiberized soles. It seems fair to assume, however, that at least 50 per cent of this production might be adaptable to fiberized soles and thus we estimate a possible daily requirement of 1,029,700 pairs of fiberized soles.

Unfortunately the shoe industry is seldom able to keep employed at its full rated capacity and we must make further deductions in order to arrive at a fair estimate of the possible demand. It is fair to assume a working year of 200 days' production and we thus find that the total annual requirements of fiberized soles might be 205,940,000 pairs.

Assuming that the rubber manufacturer might desire to run his plant on a basis of 300 working days in the year, we find that this requirement would mean an average daily production of 686,466 pairs per day.

At an average price of 33 cents a pair, this would mean an annual volume of business amounting to \$67,960,200. The average price herein taken is a very low one and the reader will note that these figures do not take into consideration anything but the manufacture of new shoes. The repair trade will consume an enormous quantity of soles in addition to the above, and at a slightly increased price.

No actual statistics are available, but the production figures for fiberized soles today are stated by some to be around 25,000 pairs daily, which means that we are now supplying about 3 1/2 per cent of the possible field. A business that has already reached a volume of \$2,500,000 yearly and which has a possibility of growth to thirty times that figure, should not be considered lightly, for, while the past five years were profitable ones in these specialized products, there is yet much work to be done.

Only a few retail shops make a reasonable showing of shoes with fiberized soles and when they do display them, their appearance does not always stand well by comparison with leather-soled footwear. A line here and there is the usual finding, but nothing like a complete line for men, women and children. Something must be done to bring this fiberized footwear into the class of its leather-soled brother and a brief discussion of some of the difficulties attending this will not be amiss at this time.

SUGGESTIONS TO SHOE MANUFACTURERS.

It is natural that having pursued the even tenor of their ways for decade after decade, shoe manufacturers should resent the suggestions of rubber manufacturers as to how shoes should be made. That, at least, is a fact, but it does not alter the other fact that the finish of a shoe often commends it to the purchaser. With the edges of fiberized soles left rough and unfinished on the shoes they can never be of prepossessing appearance. This matter of refinement in finish rests largely with the shoe manufacturer because it has been pretty clearly demonstrated that with a little greater care and slightly altered machine equipment or treatment, he can considerably improve the appearance of the fiberized soles on his lines of shoes. The manufacturers of shoe machinery have made the way comparatively easy by perfecting special machines and parts for these processes, but as they mean an increased investment in machinery they have not received the attention they should. The dominating factor in the matter, however, is one of labor. The shoe manufacturer realizes that to finish the edges and bottoms of fiberized soles means an extra operation or at least a different one and this means a change in the existing labor schedule. He does not take kindly to a plan or suggestion that will disturb a class of labor which has already shown itself to be highly sensitive to price schedule agitation and changes. Makers of shoe inks and finishes for these soles have much to do along constructive research work and toward the

production of an edge ink that may be set and worked in the customary way without chipping off the edge with slight handling.

Manufacturers admit that fiberized soles do not require the handling before application that leather soles do. They are also aware of the fact that a lesser number of operations is necessary to attach and finish them. Besides these two very substantial savings in handling and manipulation they are confronted by the fact that instead of paying an average price (today) of 90 cents per pair for oak leather soles, they can buy a fiberized sole that will wear as well, if not better, for 45 cents. In addition they may capitalize as they please on the additional benefits of flexibility and waterproofness. Many shoe manufacturers agree that where there is such a ready method of effecting economies in shoe cost without impairing the value to the wearer, a little greater effort in the matter of style and finish is worth while and they are concentrating their attention upon these points.

HINTS TO RUBBER SOLE MANUFACTURERS.

Rubber manufacturers must bear in mind the fact that no fiberized product can be a "blooming" stock and be permanently successful with the shoe trade. Its very appearance is against it and, moreover, all efforts at better finish will have been defeated for this bloom will destroy them.

Fiberized soles that stretch appreciably are equally undesirable, for it matters not whether they stretch in attaching or in wearing, the very mischief is the result. Style features and the lines of the last and pattern are built into a shoe and once built in, they must not be lost through instability in the sole itself. Soles have been produced that are wonderfully free from stretch in either direction so it is evident that this point has been realized.

The fibrous content of these compounds is an important matter for the various ingredients must be bonded together in a tough, fibrous mass that will lend itself to the process of "loose-nailing" these soles in shoe manufacture. Such soles should be available for heavy work shoes where only nailed work is desirable. Some soles have met with partial success in this direction, but for one reason or another the field remains hardly touched as yet. Consider for a moment the fact that such a shoe would have a bottom impervious to the action of lime and phosphate fertilizers used on farm lands, unaffected by the ammonious seepage of barn and farm-yard enclosures, and withal, be waterproof and slip-proof to all kinds of walking.

One of the truly important fields for these supersoles is in the manufacture of children's shoes. Let the little ones go to school staunchly clad with shoes bearing waterproof, slip-proof and durable soles instead of soft, spongy, water and dew-soaking leather soles. Very close cooperation between the manufacturers of children's shoes and fiberized soles should prevail and for mutual advantage.

Some mechanical difficulties seem to have thus far beset those who have tried to manufacture a fiberized product in sheet form. Such a soling would meet with a ready sale as has been proved by the few partially successful attempts in this direction and all that seems now to be necessary is persistent research and mechanical genius to bring about perfected processes for manufacture.

Soles of lighter gravity are also needed. At present the leading products compare favorably with sole leather, but as the thickness of fiberized soles is nearly always greater than leather soles for the same shoe, some product of lesser gravity should come forth to offset the actual difference in weight. Lightweight compounds have been produced with gravities as low as 1.03 which is considerably below the average product today of 1.30. A compromise gravity figure of 1.15 should be easily obtainable.

THE SUCCESS OF COMPOSITION SOLES.

Let it be known that various fiberized soles have already proved their value in wearing tests on the soles of Army shoes in actual warfare and in cantonment usage. Under Government tests these

materials have repeatedly outworn leather soles. In addition they have offered slip-proof and waterproof features besides great flexibility and ease in breaking in new shoes. Not only in the Army have these tests been made, but in civilian life as well, and many reports are available where fiberized soles have greatly outworn leather on the shoes of men, women, boys, and girls.

Men accustomed to being out in all inclemencies of the weather, declare that fiber soles protect their feet completely and give them greater walking comfort than does leather. A railroad fireman once told the writer he liked their "sure footed" feeling when he swung up the steps of his cab and that they outwore leather soles when in contact with hot coals and cinders.

Orthopedic surgeons state with perfect frankness that fiberized soles allow the muscles of the feet to flex and function with greater ease and regularity, and thus guard the feet from many of the ills caused by undeveloped foot muscles and retarded blood circulation in the extremities.

Those who have come to know fiberized soles for what they are have learned to swear by them instead of at them and only lament the fact that they are not obtainable on a greater variety of shoes. Any Boy Scout who has worn fiberized soles will assert that he likes them because he can climb the rocky and grassy places without fear of slipping and that his feet do not tire easily on the long "hikes" with his company.

ATTRACTIVE BUSINESS POSSIBILITIES.

Rubber manufacturers will appreciate the fact that fiberized soles are not a seasonal product like garden hose, but that they are a steady all the year around product for the manufacturer who can produce a compound that will meet the requirements. The whole rubber trade should work together for a product that will meet these demands—one that will attach to heavy shoes with nails, one that will apply to children's shoes without ripping and puffing and one that will apply to house slippers and thus afford comfort and surefootedness at every step. These problems once solved, a business comparable with almost any of the other great industries in rubber is assured.

SIXTH NATIONAL CHEMICAL EXPOSITION.

The Sixth National Exposition of Chemical Industries, which opens September 20, at Grand Central Palace, New York City, will be the biggest display of its kind ever seen. Four floors of the Palace are necessary to house the display, and because of the remarkably wide range of the exhibits this year, the exposition will be divided into sections.

The New Jersey Zinc Co.'s display will occupy booth No. 9 and a portion of booth No. 8, on the main floor, and be in charge of W. Homer Hendricks, general sales engineer. One exhibit will show the route of the zinc ore during manufacture, as well as the ultimate uses of the products. Various zinc products of the "Horse Head" family will also be displayed.

The Morse Chain Co., Ithaca, New York, will exhibit a number of samples of different chains, showing the Morse rocker joint, from 1/2-inch pitch to 3-inch pitch, and in several widths illustrating the chain as used for 1/2-h.p. to 5,000-h.p. T. G. Anderson, manager of the New York office, will be in charge, assisted by H. W. Evans, sales engineer.

The Uehling Instrument Co., 71 Broadway, New York City, will exhibit its fuel-saving device at the Chemical Show, and also at the National Association of Stationary Engineers Convention, Milwaukee, Wisconsin, September 13-17. The principal products to be displayed will be the new "Style U" CO₂ recording equipment, which measures the heat discharged up the chimney, and other boiler-room instruments.

The National Aniline & Chemical Co., New York City, will have a comprehensive exhibit of dyes and intermediates of their own manufacture, including rubber chemicals.

CLIFTON SLUSSER, GENERAL SUPERINTENDENT.

CLIFTON SLUSSER, who has been appointed general superintendent of the new Los Angeles factory of the Goodyear Tire & Rubber Co. of California, is one of the youngest men

CLIFTON SLUSSER.

in the country holding an executive position of equal responsibility. He is but thirty years old and started with the Goodyear company less than nine years ago.

Born in Massillon, Ohio, Mr. Slusser left school when eleven years old to go to work as a glass blower. Since then he has been machinist's helper, plumber, and later drifted into the Goodyear employ as stenographer and utility man for William Stephens, now production superintendent of the Akron plant.

Meanwhile he had been adding what he could to his education at night in business colleges. At the Goodyear factory he at once arranged to take a factory course after hours, getting into overalls and working through every department. Whenever an emergency arose he got into it, and the harder the job the better he liked it. When the flood of 1913 tied up the Goodyear plant and volunteer workmen were called for, Mr. Slusser was the first to respond. His work in this emergency brought him to the attention of P. W. Litchfield, factory manager, who chose him to organize the Goodyear Flying Squadron shortly after.

The Flying Squadron is a group of men who have worked through every department of the factory and are used to balance production. It now numbers 1,400 men and has already developed several hundred executives for the company.

All this time Mr. Slusser was studying business economy, factory management and corporation organization at night. Other opportunities came to him. He ran a department while the foreman took a vacation. He took charge of the Canadian plant during the illness of the superintendent. He organized an engineering squadron among the machinists and other mechanical men. Successively he took over the efficiency department, the planning department, the factory expert work, the company's garage and trucking work, the labor department and the aeronautical work. About a year ago he was made personnel manager and admitted to the executive council, a group of five men who, under Mr. Litchfield, are responsible for the operation of the entire factory now employing 33,000 men in Akron alone.

Mr. Slusser's promotion to complete charge of production at the new plant in the West, which will start operations with 5,000 men and will produce 5,000 tires a day at the outset, is the logical climax of his record in Akron.

A NEW RUBBER MAT.

A new white or marbled light, pliable rubber mat, known as the "La-tite," and which is made of live, elastic stock, clings closely to bathroom floors, ships' decks, and similar surfaces by having been cured on a rounded mandrel, which gives an unnoticeable curl to the edges. It has fine corrugations, even soft to bare feet, and can be scrubbed indefinitely. Hotels are using them to save the cost of laundering bath rugs, and for sanitary reasons. They are also being used in front of hotel room doors and dressers to save wear on carpets, the mats being obtainable also in several dark, solid colors to match most carpets. (George W. Eno Rubber Co., 1026 South Los Angeles street, Los Angeles, California.)

INTERNATIONAL DISCUSSION OF CLINCHER AND STRAIGHT-SIDE TIRES.

A VERY INTERESTING DISCUSSION between the editor of "Omnia," the well-known French automobile journal, and the technical assistant to the president of the United States Tire Co., regarding the advantages or disadvantages of the straight-side tire as opposed to the clincher tire, brings out the following points:

THE FRENCH VIEWPOINT.

Americans have gone back to rims with detachable side rings, and even split rings which the countries that invented the automobile, with France in the lead, devised in the early days of pneumatic tires but soon found to be wrong in principle and discarded.

The fundamental fact in this pneumatic tire question is that the Americans have never been able to attain perfection in the manufacture of soft tire beads. They have never been able fully to obtain that combination of strength and flexibility from which the clincher bead tire derives its true value. They grew impatient and not wishing to experiment, pulled out of the dust of our stock-room the stiff bead, the bead with cables buried in it, and decided to use this type of bead in spite of everything.

Europeans mount their tires on one-piece rims by stretching their flexible beads over a groove into which the beads slip once they are in place. This is the clincher type.

Americans do away with the beads, make the sides of their tires straight and vertical, and insert into them non-stretchable steel cables, which makes it necessary first to split the rim and then to reinforce the parts.

If an American has a break-down, in nine cases out of ten he does not personally try to solve the trouble. He puts his car in a garage and leaves the work to a professional repairman.

This custom is easy to follow over there for the reason that automobile riding is largely restricted to cities, big suburbs, and highways, where repair shops are abundant. Such a great number of cars necessarily results in a huge number of repair specialists, it is easy to understand that these specialists can afford first-class shop equipment.

On the other hand, in France the number of automobiles in use is comparatively insignificant—90,000 in 1919. Motor cars are widely scattered and repairmen are few and far between. For these reasons the solution of tire troubles falls on the driver and the work has to be done on the road.

This difference of conditions is vital. It constitutes practically the whole problem.

THE AMERICAN ANSWER.

The straight-side tire was built because it was felt that a more dependable, safe and simple fastening than the hooked bead of the clincher type was needed for heavier cars. For safety and dependability we wanted a tire which could not under any conditions blow out over the rim—one in which the beads did not require a secondary locking device such as lugs, spreaders, etc., to hold them in place once the primary locking device—inflation pressure—suddenly vanished through a puncture or blowout. We also sought a combination of bead and rim contour that would not allow the gouging of the tire by the edge of the rim when sudden deflation occurred in service.

As our development of the straight-side tire progressed, we found that we had introduced not only a more safe, dependable and simple fastening, but also a tire which would deliver consistently greater mileage than the best clincher tire we, or any others, could build. In studying the reasons for this difference, we have come to the conclusion that they lie in the better structural arrangement of the plies of fabric or cord at and above the bead proper and in the larger volume of air carried by the straight-side type. These are the basic reasons and they explain the margin in favor of the straight-side when tires of both types go through a road test without injury. The margin becomes still greater if the tires are run flat even the minimum distance re-

quired to stop the car after a puncture or cut has occurred. Under these conditions the deflated straight-side tire lies naturally over the out-turned flanges of the rim without injury, while the in-turned flanges of the clincher rim cut and chafe many miles out of the clincher tire. Furthermore, the straight-side tire will withstand under-inflation far better than will the clincher.

It is very easy to catch the tube under the toe of a clincher tire in mounting the tire—something which can not happen to the tube in a straight-side tire. Also, unless lugs are used, the tube in a clincher tire can easily be pinched under the beads when the toes of the latter rock as the car takes a curve at speed. In the straight-side type there is no rocking of the beads under any conditions.

TESTING SHIPPING BOXES.

IN A TEST for strength of shipping boxes, the object of which is a simulation of the rough knocks, bumps and jars of handling which a loaded box may encounter in railroad traffic, there has been designed a machine by which the railroad usage which a box may meet in a 2,000-mile haul can be duplicated in four or five minutes.

The first machine of this kind—known as the drum box-testing machine—was designed by the United States Government Forest Products Laboratory at Madison, Wisconsin. The results of the box tests made at this laboratory were published in THE INDIA RUBBER WORLD, August 1, 1919, pages 626-628.

DRUM BOX-TESTING MACHINE.

The machine installed at the Mellon Institute, shown herewith, is an improvement over the original tester in that the inconvenience of overhead pulleys and shafting has been done away with by the substitution of a reduction gear for cutting down the motor speed to the drum speed of two revolutions per minute.

A valuable field of investigation and scientific study of the construction and materials of packages is opened up by the new machine, such as best methods of interior and exterior packing for fragile or irregular shaped objects; the determination of proper specifications for containers carrying various commodities, etc.

The Container Club of Chicago, an association composed of corrugated and solid fiber box manufacturers of the United States, offers free service in the designing of scientific packing methods for the various commodities capable of being shipped in fiber containers.

Rubber Hose in Painting, Asphalt and Cement Coating.

THROUGH the development of paint guns, sprayers, and atomizers, for applying paints and protective coatings by the use of compressed air, rubber hose is now used very extensively. Painting with mechanical appliances for concrete and masonry surfaces, structural ironwork, bridges, ships, mesh-wire factory fences, tanks, castings, machinery, car trucks, underbodies and other large equipment has been a recognized method for several years, and has generally superseded the hand painter.

With the modern paint gun the work is done when wanted in a remarkably short time, with little or no interruption of business,

without depending on a large labor force and at the lowest possible cost consistent with a thorough, durable job. The early difficulties, such as loss of paint, excessive scattering and spattering over surfaces not to be painted, lack of control in the wind, and volatilization of the paint oils while passing through the air have been overcome by the perfection of ingenious patent nozzles and the provision of special full body oil paints peculiarly adapted to the purpose.

With an ample length of rubber hose and a twelve-foot extension arm, scaffolding and swing-staging can be dispensed with very largely. Out of doors one man and a helper can cover from 1,000 to 2,000 square feet per hour, multiplying the labor value from eight to ten times. As compared with the hand method a saving of approximately \$1.50 per gallon can be effected. Indoor painting jobs can be done at the rate of 1,000 to 1,600 square feet per hour. The right paint applied to factory interiors by this method will conserve much light, thereby saving electric current, eyesight and daylight working hours. It gives a smooth, fine, hard, dirt-resisting coating having neither the chalky whiteness that absorbs light and quickly becomes dirty, nor the glossy surface that causes a blinding glare or dazzling flicker. It diffuses light as it reflects it and fills the interior with a soft, even radiance. Moreover, a film of paint can be built up in one operation that is the equivalent of two or three hand brush coats.

The method is equally efficient on any surface, from smooth

wood finish to the roughest masonry, and can be used to special advantage on cast stucco, rock-faced walls, rough lumber, brickwork with recesses, broken-down masonry joints, surfaces under eaves, lattice work, structural steel, and all places inaccessible to a brush. This is because the perpendicular application of the paint is certain to penetrate voids better than brushing across the surface.

An efficient brushing action by the powerful compressed air jet is of advantage for cleaning dirty surfaces and in reaching corners and crevices for which the hand painter's implements,

the wire brush, putty knife and chisel, are inadequate.

A pneumatic painting outfit consists essentially of a paint tank with the necessary valves, gages, etc., a motor-driven air-compressor, a nozzle or brush and the rubber connecting hose for paint and air. The paint, ready for application, is poured into the tank. An agitator, operated by hand or compressed air, is available for use when necessary. A compressed air line leads to the tank with a branch line for air and paint from the tank to the nozzle. Sometimes the former is ordinary $\frac{3}{8}$ -inch heavy air hose, while the latter is $\frac{1}{4}$ -inch flexible metal-lined oil suction hose, having

coiled coppered-steel wire embedded in the wall to give it strength and rigidity. The lining, friction and cover of this hose are specially compounded to resist the action of the oil and paint, as it is important that the rubber shall not flake or peel off and get into the delicate orifices of the spraying nozzle. The adhesion of the rubber friction must be especially strong in order to retain the wire firmly in place. Special paint hose, three, four and five-ply, is also made with internal diameters of $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, 1 and $1\frac{1}{4}$ inches, having a ply of seamless braided material over the plies of duck, with a rubber cover over this, so that the structure of the hose is held intact, preventing the duck from unwrapping and coming apart after long contact with oil and paint.

Many of the leading rubber companies are employing these pneumatic painters for their buildings, factory interiors, etc., and several of them use a special equipment with a compact nozzle

SPECIAL RUBBER HOSE IS NECESSARY EQUIPMENT FOR PNEUMATIC SPRAYING MACHINES.

resembling a pistol and trigger operated to paint the inside of pneumatic tire casings with soapstone paint. For whitewashing and applying cold water paint to factory interiors, where power is not available, a double-acting cog-gear spraying machine that operates by hand can be utilized to excellent advantage.

ASPHALT AND ROCK GRIT SPRAYING.

The pneumatic spraying principle has also been applied in building. By means of a special gun, side walls and ceilings are plastered, foundations and floors are damp-proofed and concrete structures are waterproofed, with a coat of pure asphalt compound, applied at normal temperature and under high pressure. This hermetically seals the surface and protects the plaster against water damage, stain, cold air infiltration and the lime sulphate salts in concrete which cause plaster to decrystallize. Over this a coat of rock grit, also gun applied, makes a scratch coat that requires only a finish coat of plaster in order to give a ceiling of excellent whiteness for light conservation or ideal for decorating. Side walls prepared in this manner and given two,

instead of the usual three coats of gypsum hard plaster, afford complete insulation, overcoming all sweating and condensation of moisture. For applying the scratch coat, sand-blast hose is used, having a heavy lining of rubber to resist the cutting action of the rock grit.

With the asphalt gun concrete structures, such as basements, reservoirs, bridge decks, etc., are water-proofed

HAND-POWER SPRAYER.

with asphalt compound and built out to sufficient thickness with mastic or membrane. Dampproofers are also applied to foundation walls that are to be furled and to cinder-fill mixtures under matched flooring. The gun cleans the voids, fills them full of asphalt and builds out in an even, laminated coating. Speed renders this method advantageous for quick construction.

SPRAYING PORTLAND CEMENT.

Reversing the arts of war, the destructive principles of gun-fire are being employed in the constructive arts of peace, and a cement gun, much like the paint and asphalt guns, is being used for rapid-fire building in England. At Southend-on-Sea a house-building company is putting up houses having wooden frames covered with tar felt and wire meshing. A cement gun is used to spray prepared cement from a large hopper to cover the meshing. In this way 15,000 square feet can be laid in eight hours.

These modern methods in building and structural maintenance depend in large measure upon flexible rubber hose for their efficiency. And confronted as the whole world is by such a serious shortage of houses, it seems likely that these devices which save time and labor, speed up production, and save expense, will quickly come into general use.

REPLETE WITH INFORMATION FOR RUBBER MANUFACTURERS—H. C. Pearson's "Crude Rubber and Compounding Ingredients."

JUDICIAL DECISIONS.

GAMMETER VS. BACKDAHL.—Court of Appeals, District of Columbia. Decided June 2, 1920.

Appeal from a decision of an assistant commissioner of patents in an interference proceeding awarding priority to Backdahl for an invention filed December 14, 1915, relating to a metallic mandrel for curing tires. Gammeter conceived and disclosed his invention September 7, 1915, endeavoring meanwhile to evolve a fluid-tight, expandable lead core adapted to produce a cord as well as a fabric tire.

The Examiner of Interferences and the Board of Examiners-in-Chief held that Gammeter was diligent at the time Backdahl entered the field and reasonably diligent from that time until the filing of his application. The Assistant Commissioner disagreed with this finding and therefore reversed the decisions of the lower tribunals.

Where, as here, it clearly appears that the party first to conceive the invention was in good faith engaged in perfecting it at the time his adversary entered the field, that party should not be deprived of the fruits of his discovery because his efforts were not as successful as he hoped they would be.

Therefore, the Examiner of Interferences and the Board of Examiners-in-Chief, being convinced that Gammeter was not lacking in diligence, reversed the decision of the Assistant Commissioner and awarded priority to Gammeter. ("United States Patent Office Gazette," July 27, 1920.)

THE WOOLDRIDGE & FOX BALLOON FABRIC PROOFING PATENT.

In 1916, Patent No. 105,137 was granted to Wooldridge & Fox, for "Improvements in impregnating compositions for proofing fabrics and other flexible materials." In 1917 the North British Rubber Co., Limited, applied for revocation of that patent, or a specific reference to its own patent, No. 5,915 of 1915, for "An improved fabric for balloon envelopes and the like, and the method of manufacturing and aftertreating the same," on the ground that the invention claimed in the patent of 1916 had been claimed in the patent of 1915.

The application was dismissed by the Chief Examiner, who ordered, however, that the specification be amended by the insertion of a general reference to the state of the art. An appeal to the Court by the North British Rubber Co., Limited, was later dismissed, it being held that the invention of the patentees was not the same as that of the opponents; that, even if a fabric made in accordance with the claims to which objection was taken would be an infringement of the opponent's patent, that would not in itself, be a sufficient reason for striking out those claims; that the object of the insertion of a specific reference was not to preserve or assist the opponent's rights, but to protect the public in cases in which, but for the insertion, they would be likely to be misled; and that there was not sufficient reason for giving any special warning. (Supplement to "The Illustrated Official Journal" [British patents], June 30, 1920.)

"BOX WORK" MEANS ABOUT THE SAME THING IN THE AUTO INNER tubes as "shop worn" means in clothes. Both are damaged goods. When an inner tube leaves a rubber factory, it is ordinarily packed in waxed paper and placed in a box to keep it in perfect condition. But this waxed paper packing will not protect the tube carelessly thrown in the tool box of a car, where the constant jolting and swerving of the car cause the loosely packed tube to chafe through at the folds.

Tubes will remain in the same serviceable condition as when placed in the car, if carefully wrapped in soft cloth or paper so that they cannot slide around in the wrapping. Better even than this, however, is the purchase of a tube bag. It is not only excellent but cheap insurance against tube cutting and chafing. (The Miller Rubber Co.)

THE DOLLAR IS BIGGEST IN BUYING TIRES.¹

CAREFUL ANALYSIS of the rubber tire manufacturing business does not indicate a downward trend of tire prices, according to expert business analysts, whose opinion is based upon the comparative increases in price of practically all commodities

CHART SHOWING WHY PRESENT TIRE PRICES ARE LOW.

hold furnishings, with commensurate percentages of increase in the prices of practically all other commodities.

The sudden curve back from the peak of high prices, precipitated by currency deflation and restriction of credit, unquestionably has led many motorists to anticipate a drop in tire prices, and consequently has caused many to delay contemplated purchases until the drop could come. But the comparatively low price of tires at this time does not indicate such a downward trend. Hence it is argued that while the American public may be justified in waiting for prices of certain commodities, which now are selling at better than 100 per cent advance over 1914, to decline, there is nothing to justify a similar decrease in prices of tires.

Another important factor is the added mileage and greater durability of the highly perfected tire today. Six years ago a four-thousand mile tire was unusual. Today, an 8,000-mile tire performance is a very ordinary record. Figuring conservatively upon this mileage basis alone, a 1920 tire will deliver at least 100 per cent more mileage than a 1914 tire, and yet costs but 37 per cent more. The tire selling for \$50 in 1914 cost one and one-quarter cents per mile, based on 4,000 miles of service. The same tire now gives at least twice the mileage and costs only \$70, making the cost per mile only seven-eighths of a cent. This means that the same mileage actually is being purchased today for 30 per cent less money.

This improvement in the 1920 tire over the 1914 tire, it is pointed out, even is more marked in a comparison of the 1910 tire with that of today, the average mileage today being fully three times that of a 1910 tire. Motorists in 1910 paid \$35.65 for a 30 by 3½ tire, and \$11.90 for the same size of tube. Today they pay only \$23.50 for the same tire and \$4.50 for the tube—getting three times the mileage for \$19.55 less money. On the 34 by 4 tire, the 1910 price was \$53.40 compared to \$40.10 today, and \$14.90 for a tube as compared to \$36.30 today—a saving to the

motorist of \$21.90 per tire, or \$87.60 for full tire equipment, with three times the 1910 mileage.

There are several elements directly responsible for this condition. Principal among them is the improved method of manufacturing automobile tires, of raising and curing rubber and of making cotton tire fabric, all made possible through long experience, careful research work and the invention of more modern machinery. Secondly, quantity production has permitted greater manufacturing economy, overhead reduction and the marketing of the finished tire at a lower cost to the consumer. Were conditions normal and were the purchasing value of the dollar not cut practically in two, prevalent tire prices might not be considered so unusual. But when it is taken into consideration that wages, freight rates, food prices, the cost of cotton and the various compounding ingredients used in the manufacture of tires have soared, and in nearly all cases more than doubled, the fact that automobile tires are of better quality and yet are selling for less than they did ten years ago constitutes a refreshing thought and a decided relief from the incessant reminder of the high cost of living.

Since August, 1914, the price of cotton has jumped from 20 cents a pound to \$1.35 a pound—an increase of 575 per cent. The manufacturing cost of cotton fabric for automobile tires has increased 190 per cent, while the cost of compounding ingredients has increased approximately 68 per cent. The price of crude rubber today is unusually low, compared to other materials; but the present low level in price does not affect tire prices, due to the fact that vast quantities of rubber were contracted for before the break in price.

The present "hold back" attitude of the motoring public is believed due to a misunderstanding of actual facts, and to a lack

HOW THE PURCHASING VALUE OF OUR DOLLAR HAS SHRUNK! THESE SHARPER AND DEEPER VIEWS SHOW THE TENDENCY OF INFLATION IN A DOLLAR'S PURCHASING POWER, WITH REFERENCE TO VARIOUS COMMODITIES, AS COMPILED BY THE UNITED STATES DEPARTMENT OF LABOR.

of appreciation of the availability of automobile tires at prices so near their pre-war level. In business circles it is felt confidently that prices of practically all other commodities will have to break and show an appreciable decline, before the situation will justify any reduction in tire prices.

A NEW FORM OF COMPOSITE BELTING IS THE INVENTION OF ROBERT RUSSELL OF MIDDLETON, ENGLAND. IT AFFORDS A NEW USE FOR WASTE LEATHER, AND IS SAID TO COMBINE ALL THE ADVANTAGES OF BALATA AND RUBBER BELTING, WITHOUT THE DISADVANTAGES OF EITHER. IT DOES NOT ABSORB OIL AND MOISTURE, AS A LEATHER BELT DOES; NOR IS THE OUTSIDE PORTION WRENCHED AND STRETCHED, AS IS SO OFTEN THE CASE WITH RUBBER BELTING.

¹ By Ralph C. Bushey, Goodyear News Service.

S. A. E. Standards Report of the Tire and Rim Division.

THE FOLLOWING REPORT of the Tire and Rim Division of the Society of Automotive Engineers, as amended and accepted by the Standards Committee, was approved by the Council at the general meeting of the Society, held at Ottawa Beach, Michigan, June 21. These new standards require only the approval of the members of the Society to be obtained by letter ballot.

AUTOMOBILE RIM VALVE HOLES.

The Tire and Rim Division recommends that the present S. A. E. standard for automobile rim valve holes be extended to include the dimensions for the 5, 8 and 10-inch tire rims and that certain lengths in the present standard be increased. The present S. A. E. standard revised and extended as recommended by the Division is given in the accompanying table:

Rim sizeinches	3½	4	4½	5	6	7	8	10
A (min.)inches	3½	4	4½	5	6	7	8	10

FELLOE-BAND TOLERANCES.

Owing to variations in the thickness of commercial tapes, with the resulting inaccuracy of wheel measurements, it is recommended that approved standard tapes be used for measuring felloe-band circumferences, of which one set is intended for truck and one for passenger-car wheels.

The Division therefore recommends that the present S. A. E. standard for allowable tolerances in felloe-bands be extended to include the following note:

It is recommended that all measurements of truck and passenger-car wheel circumferences be made with approved standard wheel tapes furnished by the Tire and Rim Association.

DEFLECTION AND SET TEST OF AUTOMOBILE PNEUMATIC TIRE RIMS.

The present S. A. E. standard for deflection and set test of automobile pneumatic tire rims specified the pressure, deflection and permanent set for 3½, 4, 4½, 6 and 7-inch rims only. The Tire and Rim Division now recommends the pressure, deflection and permanent set for the 5, 8 and 10-inch rims. The present S. A. E. standard extended to include the Division's recommendation follows:

PNEUMATIC TIRE RIM TESTS.

Rim Size Nominal, Inches.	Maximum Pressure, Pounds Per Square Inch.	Maximum Deflection, Inches.	Total Permanent Set, Inches.
3½	140	0.06	0.02
4	160	0.07	0.03
4½	190	0.10	0.06
5	210	0.12	0.06
6	260	0.15	0.06
7	275	0.15	0.06
8	250	0.15	0.06
10	250	0.15	0.06

The deflection should be measured from a fixed inflation load of 25 pounds per square inch for 3½, 4 and 4½-inch sections, and 50 pounds per square inch for 5-inch and larger sections up to the maximum pressures given.

MOTORCYCLE RIM SECTIONS.

Circularization of the motorcycle industry last year indicated that standard current practice includes only tire sizes which are

mounted on the CC rim. These tire sizes were adopted by the Society last winter and in order that the rim specification shall be in conformity with this list of tire sizes the Tire and Rim Division recommends that the BB rim section be withdrawn from the present S. A. E. recommended practice for motorcycle rim sections. It is the opinion of both the Motorcycle and Tire and Rim Divisions that the BB rim section can be reestablished as a standard should the use in the future of light weight motorcycles carrying the BB rim become general enough to warrant its inclusion in the standard.

CARRYING CAPACITY OF SOLID TIRES.

Solid Tire Width, Inches	36-Inch Diameter or Less.	40-Inch Diameter.
3	1,000
3½	1,300
4	1,700
4½	2,000
5	2,500	3,000
6	3,500	4,000
7	4,500	5,000
8	5,500	6,000
10	7,500	8,000
12	10,000
14	12,000

The present S. A. E. standard for carrying capacity of solid tires has been criticized to the effect that at rated truck capacity an increase in the tire carrying capacities would be justified in practically all sizes and would conform to general practice.

The Division therefore recommends that the carrying capacities specified in the present S. A. E. standard for carrying capacities of solid tires be revised to conform to capacities given in the above table.

PNEUMATIC TIRES FOR PASSENGER CARS AND COMMERCIAL VEHICLES.

The Division recommends that the present S. A. E. standard for pneumatic tires and rims for passenger cars and commercial vehicles be revised so as to eliminate the 42 by 9-inch tire and rim as regular equipment. This size tire is considered a special application as the oversize for the 40 by 8-inch on pneumatic-tired trucks and not as a regular size. It is also felt by the Division that the 44 by 10-inch is now well enough established to be included in the standard as regular equipment.

The S. A. E. standard revised as proposed is as follows:

Nominal Tire and Rim Sizes.		Oversize Tire.		Tire Seat Diameter (Rim).		Type of Rim.
In.	Mm.	In.	Mm.	In.	Mm.	
30x3½	90/585	31x4	105/585	23	585	Clincher
32x3½	90/635	33x4	105/635	25	635	Straight side
32x4	105/610	34x4½	120/610	24	610	Straight side
33x4	105/635	34x4½	120/635	25	635	Straight side
33x4½	120/610	34x5	135/610	24	610	Straight side
34x4	120/585	34x5	135/585	23	585	Straight side
34x4½	120/635	35x5	135/635	25	635	Straight side
34x5	135/610	36x6	150/610	24	610	Straight side
36x6	150/610	38x7	175/610	24	610	Straight side
38x7	175/610	40x8	200/610	24	610	Straight side
40x8	200/610	42x9	225/610	24	610	Straight side
44x10	250/610	24	610	Straight side

RIM SECTIONS AND CONTOURS FOR PNEUMATIC TIRES.

The Tire and Rim Division recommends that the present S. A. E. standard for rim sections and contours for pneumatic tires for passenger cars and commercial vehicles be revised in accordance with the dimensions submitted in the following table. This table has been extended to include the dimensions for the 5-inch rim recently adopted and for the 10-inch rim which is recommended for adoption. The radius of the fillet for the 3½, 4 and 4½ straight-side rims has been increased from 3/32 to 3/16-inch owing to trouble which has been experienced with rims cracking at this point. Tolerances have also been placed upon the height of the 3½-inch rim.

These revisions have been adopted by the Tire and Rim Association and are in accordance with present practice.

There was considerable discussion in the Standards Committee meeting relative to establishing in the standard a single set of rim and felloe-band dimensions to provide for interchangeability of the 36 by 6, 38 by 7 and 40 by 8-inch pneumatic tire on a single rim, and also the interchangeability of this application on the wheel. This matter is to receive early consideration by the Tire and Rim Division and representatives of other automotive industries who are interested in this matter.

FIG. 4. TRACTION PLATE DIMENSION.

Rim Size.	A	B	Width of Traction Plates
5	1 1/2	1 1/2	1 1/2
6	1 3/4	1 3/4	1 3/4
7	2	2	2
8	2 1/4	2 1/4	2 1/4
10	2 3/4	2 3/4	2 3/4

Note. Information recently received indicates that this report as approved by the Standards Committee should be modified as follows:

Dimensions A' on the drawing are the same as A in the table and the tolerance on A' should be plus 0.000-inch, minus 0.031-inch. The width of traction plate for the 10-inch rim should be 3 1/8-inch. In marking letter ballots members should indicate whether they approve the report with these corrections included.

FIG. 1. 5, 6, 7 AND 8-INCH FELLOE-BAND.

FIG. 3

PNEUMATIC TIRE FELLOE BAND.

An agreement has been reached among rim manufacturers for the dimensions of the 5, 6, 7, 8 and 10-inch pneumatic truck tire felloe bands, which are given in the accompanying tables. This proposal has been accepted by the Tire and Rim Association and the Tire and Rim Division recommends it for adoption as S. A. E. standard.

FIG. 3. BOLT AND NUT.

NOTE.—Information recently received indicates that this report as approved by the Standards Committee should be modified as follows:

Dimensions G in the table apply to felloe-bands for metal wheels. The corresponding band dimensions for the 6, 7 and 8-inch rims for wood wheels should be 0.688-inch. The felloe-band bolt circle diameter L for the 6 and 7-inch rims on wood wheels should be 21¼ and 21-inch for the 8-inch size.

In marking letter ballots members should indicate if they approve the report with these corrections included.

CARRYING CAPACITIES AND INFLATION PRESSURES FOR MOTORCYCLE TIRES.

The revised S. A. E. Standard for motorcycle tire sizes includes 3 and 3½-inch sections only, and it is therefore recommended by the Division that the carrying capacity and inflation pressure for the 2½-inch motorcycle tire be omitted.

A Fund for Botanical Research in the Tropics.

THE CONTINUED SUCCESS of tropical agriculture, notably plantation rubber, tea, coffee, coconuts, fibers and timber, is dependent very largely on maintaining an adequate force of properly trained scientific men to supervise the work. A veritable army of specialists is required to attend to the many diseases now attacking cultivated plants, to the biochemical problems associated with the manufacture of tropical produce, to questions of plant breeding and selection, and also the bacteriology of soils.

It is from the Imperial College of Science and Technology in London, England, that most of the trained men in this field have come in the past and must come in the future. Tropical agriculture has been to a great extent a British industry, and the Botanical Section of the Department of Biology of the Imperial College has in consequence become the recognized fountain head of information pertaining to it.

The Botanical Section is staffed by ten eminent professors, lecturers and demonstrators and many graduate students are doing excellent work in rubber growing and tropical agriculture generally. Among the latter may be mentioned H. G. Freeman, director of the Royal Botanic Gardens at Trinidad, and assistant director of agriculture for the West Indies; R. M. Richards, mycologist to the Planters' Association of Malay; F. J. F. Shaw, D. Sc., mycologist to the Indian Agricultural Service at Pusa; E. Bateson, assistant mycologist to the Agricultural Department of the Federated Malay States, now in Borneo; W. Noel, assistant superintendent in agriculture, Barbados, now mycologist to the Imperial Department of Agriculture in the West Indies; C. O. Farquharson, Government mycologist in Nigeria, recently deceased; A. Sharples, chief mycologist, Federated Malay States; H. C. Pinching and H. Sutcliffe, mycologists to the Rubber Growers' Association, Malay; H. W. Jack, assistant inspector in agriculture, Federated Malay States; A. T. Reeve, plant physiologist and mycologist to the Rubber Growers' Association, Ceylon; T. Thornton, cotton and fiber expert, Nigeria; T. Laycock, Agricultural Department, Kamerun and Nigeria; F. D. Stock, botanist to Burma, India Office; W. L. Hall and H. R. Jones, entomologist and mycologist, respectively, to the Egyptian Government; Sydney Morgan and G. S. Whitby, chemical researchers on rubber for the Rubber Growers' Association.

An exhibition was recently held by the Imperial College to illustrate the diseases affecting rubber trees and the laboratory methods now adopted to determine the life histories of specific fungi harmful to cultivated plants. Many prominent rubber growers in attendance expressed a wish that the exhibit might remain available for permanent study, so that their corectors, managers and assistants might, from time to time, interest themselves in the mycological research carried on by the Botany Section. Unfortunately this is at present impossible, owing to the limited space in the present buildings of the Imperial College

and the overcrowded condition of its various departments. Moreover, for the same reason, the rector of the college has very reluctantly had to refuse admittance to a large number of students desiring to specialize in research of value to the plantation world.

Even in pre-war days the Department of Biology found it almost impossible to satisfy the demand for men to engage in research relating to plant diseases. There is ample evidence that the future demand will be out of all proportion to the supply, both private firms and the Government having evidently decided to maintain and increase the number of scientific officers to act as advisers on problems of plant sanitation, breeding and soil conditions.

The Department must, even if it is to meet the demands made in the interests of tropical plantations alone, be supplied with additional laboratories and money for the extension of its work, to say nothing of an endowment fund. A site has been selected and plans prepared for extensions near the existing botany building, to cost, for erection alone, £70,000. The Imperial College has received assistance on a large scale from the Government, and from the London County Council towards its annual maintenance, but is now compelled to seek private aid, and a public appeal has been issued by Lord Crewe, chairman of the governing body, Alfred Keogh, rector of the College, and J. B. Farmer, professor of botany and director of the biological laboratories.

Realizing the importance of the work to private enterprise in tropical agriculture, appreciating its debt to the Imperial College for bringing expert rubber staffs to their present state of efficiency, and knowing that helping this cause helps the plantation rubber industry, the Council of the Rubber Growers' Association has unanimously resolved to give its support to the appeal. A subscription of £1,050 has been pledged by the Association and an appeal signed by Norman W. Grieve and Stanley Bois, chairman and vice-chairman, has been issued to members and other interested parties. A permanent advisory committee of the Association will confer with the staff of the Botany Section of the College from time to time on matters of importance to tropical plantations.

Up to June 25, 1920, subscriptions totaled £15,700, as follows: Rubber Growers' Association, £1,050; Harrison & Crossfield, Limited, £1,000; Herbert Wright, £1,000; company groups, £10,364; individual companies, £1,992; non-producers, £294. Checks for this fund should be made payable to the Rubber Growers' Association and crossed "Botanical Research Account."

THE MILLER RUBBER CO., AKRON, OHIO, IS INCREASING THE space devoted to its tire-repair school, so that it will be able to double the number of pupils accommodated. Four hundred have already been graduated and there are now forty-five enrolled. Sometimes classes are even larger than this number.

TORON AND TORON-TREATED TIRES.

A NEW ARTICLE, "TORON," has recently been developed as a means of decreasing the cost, improving the quality and prolonging the life of both pneumatic and solid automobile tires. In the manufacture of tires, it is employed as a liquid to impregnate the fabric, cord and other fibrous material used in their

FIG. 1—GRAPHIC CHART SHOWING COMPARATIVE FRICTION TESTS.

construction. Chemically described, it is a sulphur terpene compound produced from reaction between turpentine and sulphur dissolved in a solvent such as xylol.

A marked characteristic of toron is its capacity to thoroughly penetrate fibrous material so that the fabric or cord is completely impregnated after the solvent is evaporated. This material possesses the additional characteristic of acting as a dye, thus coloring gray goods a pleasant yellow or khaki color. Moreover, the impregnated material gains in strength so that after treatment in association with rubber in a tire structure, American peeler acquires a strength comparable to Egyptian or Sea Island fiber as used in the manufacture of tires under the prevailing practice.

FRICTION INCREASED BY USE OF TORON.

More important still is the fact that rubber may be calendered to toron-treated fabric with ease and with a complete absence of skips or blisters, as the surface of the fabric is uniformly prone to adhesion with the rubber. As a consequence of this, spreading

of a piece of the same gray goods treated with toron, the friction of the first was 15 pounds while the friction of the second was 24 pounds. Hence a 60 per cent increase in friction was realized from the use of toron-treated fabric in the building up of the tire. Fig. 1 shows this increase in friction.

IMPROVED RESISTANCE TO DESTRUCTION BY FLEXING.

As is well known under the stress and strain, to which a revolving tire is subjected, owing to the roughness of the road, the tire is being continually contracted and expanded by an irregularly acting torsional force which causes "flexing." It is probable that flexing is the severest of the many adverse influences to which a tire is subjected in actual use, and this flexing tends to cause separation of the fabric, leading to bulging and blowouts.

In a toron-treated tire the surface of the fabric ply is not only uniformly attached to the rubber, but during vulcanization the rubber flows between and around the threads of the fabric, penetrating them and bonding them to the next ply, as shown in Figs. 2, 3, 4 and 5. As a consequence the load of flexing is carried by the rubber to a larger extent than in the older tire construction, since it is more difficult to separate rubber from rubber than rubber from gray goods.

In flexing, the play of fiber on fiber of the fabric causes these fibers to wear out. Resistance to this has been found to be greater in the case of fabric made of Sea Island or of Egyptian cotton than of American cotton, but it has now been shown that when fabrics made from American peelers have been toron-treated and built into tires they show a resistance to flexing equal if not superior to that of tires built with Sea Island or Egyptian cotton. From tests carried out on commercial vehicles it is assured that fabric tires may be constructed and sold carrying a guaranty of a minimum mileage of ten thousand miles, which is a condition never before approached in this manufacture.

PROTECTING THE FABRIC FROM OXIDATION AND ROT.

Of nearly equal importance to the life of a tire is the prevention of its more readily perishable parts from coming in contact with destructive agents. Cotton is very prone to oxidation and rotting, especially when exposed to air and moisture, and particularly so when warm. To prevent this the cotton is protected by its rubber enclosure in a new tire. But in use the tire is continually exposed to abrasion and accidents of the road such as contact with sharp

FIG. 2—SECTION OF A TORON-TREATED FABRIC TIRE.

FIG. 5—SECTION OF A GRAY GOODS CORD TIRE.

REAR SHOWS THE RUBBER. WHITE SHOWS THE THREAD. MAGNIFIED 14 DIAMETERS.

becomes unnecessary and this expense is eliminated, moreover, the friction is greatly increased. From actual tests of fabric tires built by the same maker and of identical construction except that one was built of untreated gray goods, while the other was built

edges, which may cut into the fabric or cord foundation, and through such perforations may enter air, moisture, dirt and organic germs such as the spores of moulds. Dirt acts as an abrasive. Air with moisture brings about oxidation and the moulds as they grow in a moist warm atmosphere rot the cotton. Warmth is

¹ Laboratory of W. B. Pratt, Inc., Boston, Massachusetts.

ensured by the heat generated through the friction of the tire in use. Moisture, either that left in the tire in manufacture or entering through punctures in the manner described, cannot be readily removed. Hence, though a structure built up on a cotton foundation and enclosed in rubber may be proof against oxidation and rotting from the action of the agents above enumerated, so long as it is enclosed in the rubber, yet it ceases to be thus protected as soon as the rubber covering is perforated or punctured.

It is otherwise, however, with toron-treated cotton, for every fiber is individually protected from contact with air, moisture or the effects of moulds. Neither moisture left in the tire structure by imperfections of manufacture or that which finds its way into the interior of the tire through perforations can reach the cotton through its envelope.

Another cause of rotting in tires is found in the sulphur coming from the vulcanized rubber. It is known that vulcanized rubber not infrequently shows a "bloom" due to some of the sulphur used for vulcanizing the rubber appearing on its surface, and through the oxidation of this sulphur in the presence of moisture and warmth, sulphur acids are formed which attack and weaken the cotton. Toron or toron-treated cotton does not bloom. Material treated with it reduces the likelihood of moisture, which might cause such oxidation of sulphur being left in the interior of the tire. And toron-treated cotton fiber is immune from attack from such sulphur acids as are formed within the tire.

VULCANIZING RUBBER TO SOLID TIRE RIMS.

An additional and very valuable characteristic of toron is that by its use rubber may be vulcanized to iron, thereby producing a complete adhesion of a solid tire to the rim of the wheel.

It is well known that rubber, whether vulcanized or not, does not adhere to iron and advantage is universally taken of this fact to vulcanize rubber articles in iron molds, yet, by a simple treatment of the rim surface with toron, on application of the rubber to this treated surface and its vulcanization, a bond is formed which resists rupture more than any other part of the tire, and thus one of the most serious defects in solid tire construction has been overcome.

NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS, STANDARD CLASSIFICATION FOR SCRAP RUBBER.

CIRCULAR F.

THIS STANDARD OF PACKING was adopted by the Scrap Rubber Division and approved by the Board of Directors of the Association on June 30, 1920, to be effective from July 1, 1920, to July 1, 1921, at which date a new circular will be issued.

All goods bought or sold under the following specifications are understood to consist only of domestic or Canadian manufacture, unless otherwise stipulated. All grades of scrap rubber shall be bought and paid for net weight, mill weights to govern, and no allowance for bagging or covering of any kind shall be made, nor shall the same be returned to the seller.

DELIVERY.

- A.—All shipments of scrap rubber must be contained in bags, bales, bundles or other suitable containers, and if shipped loose a charge of 34-cent per pound shall be made for extra handling, except automobile tires and railroad hose which may be shipped loose.
- B.—A carload unless otherwise specified shall consist of fifteen tons.
 - A ton when applied to domestic stock shall mean 2,000 pounds.
 - A ton when applied to foreign stock shall mean 2,240 pounds.
- C.—Shipments direct to a mill shall consist of not less than 2,000 pounds. Otherwise a charge of 1/2-cent per pound shall be made.
- D.—All scrap rubber of foreign manufacture shall be bought C. I. F. port of entry as per weight determined by sworn weigher's certificate, seller to bear expense of weighing, and seller subject to same conditions as govern purchases of domestic manufacture.

REJECTIONS.

Upon his request all rejections shall be returnable to the seller within thirty days from the time notice of rejection is received by him and upon payment by him of 1/2-cent per pound to cover cost of sorting and rebaling. If shipping instructions are not furnished within the above-mentioned thirty days the purchaser shall be at liberty to make such disposition of the material as he may see fit. The above does not apply if rejected material is purchased by the buyer.

F.—When shipments are made direct to a mill each grade of scrap rubber must be packed separately, and if not so packed a handling charge of 1/2-cent per pound will be made.

G.—All scrap rubber must be dry and free from dirt. All scrap received wet may be dried by the buyer, such shipments to be paid for on the dry weight as ascertained.

H.—A purchase contract shall not be considered filled until the full quantity within 2 1/2 per cent, more or less, net weight, shall have been received, any rejections to be replaced within thirty days of the date of notice of rejection to the shipper.

EMBARGO.

I.—If through embargo a delivery cannot be made at the time specified the contract shall remain valid and shall be completed immediately on the lifting of the embargo, and terms of said contract shall not be changed. Notice of embargo must be served by seller.

CODE WORDS APEAR IN ITALICS.

1.—**Rubber Boots and Shoes (Apear).** Deliveries of rubber boots and shoes must consist of black rubber boots and shoes only. They must be dry and clean, free from dirt and leather, and all metal excepting that applied by the manufacturer.

1-(a).—**Colored Rubber Boots and Shoes (Auto).** Must consist of red, white and tan, and fancy colors, and must be packed and sold separately. The grading and packing to conform to Article 1.

2.—**Trimmed Artics (Band).** Must be closely trimmed and free from leather and any composite non-rubber bearing material, such as fiber, inner soles, etc.

2-(a).—**Untrimmed Artics (Bird).** Must be free from leather and any composite non-rubber bearing material, such as fiber inner soles, etc.

3.—**Trimmed Tennis Shoes (Clam).** Must be black; closely trimmed; free from molded soles and leather, or any composite non-rubber bearing material such as fiber inner soles, etc.

3-(a).—**Untrimmed Tennis Shoes (Cool).** Must be black and free from leather and molded soles or any composite non-rubber bearing material, such as fiber inner soles, etc.

4.—**Mixed Standard Auto Tires (Dirk).** Must be free from the following: unguaranteed tires; heavy beaded tires; non-pneumatic or filled tires. Must not contain any hard, oxidized, burnt, single tube, motorcycle, stripped or badly worn tires, nor tires containing leather or metal.

5.—**Unguaranteed Auto Tires (Earl).** Must be free from non-pneumatic or filled tires, heavy beaded tires, hard or oxidized, stripped, badly worn or tires with leather or metal.

6.—**Badly Worn Auto Tires (Farm).** Must be free from hard or oxidized, non-pneumatic or filled tires, heavy beaded tires and tires with leather or metal. A reasonable proportion of the tread must be on the tires.

7.—**Stripped Auto Tires (Game).** Must be free from hard or oxidized, non-pneumatic or filled tires, heavy beaded tires and tires with leather or metal.

8.—**No. 1 Auto Tire Peelings (Hawk).** Must be free from cloth, metal and leather.

9.—**No. 2 Auto Tire Peelings (Lead).** Must consist of peelings from auto tire treads only, and must be free from leather, metal, stripped, auto tire fabric, also free from beadless auto tires and free from dykes and sole walls.

10.—**Bicycle Tires (Jade).** Must be free from hard or oxidized tires and tires with wire and beads.

11.—**Solid Wagon and Cab Tires (Kite).** Must be free from metal, baby carriage and rubber soles.

12.—**Solid Motor Truck Tires with Cloth (Lamp).** Tires must be 2 1/4 inches or over in diameter. Must be free from metal and tires with hard or fibre bases.

13.—**Clean Solid Motor Truck Tires (Life).** Must consist of tires over 2 1/4 inches in diameter. Must be free of all metal, hard bases, fiber and cloth bases.

14.—**Airbrake Hose (Mash).** Must be free from metal, hard or oxidized hose and steam hose.

15.—**Garden Hose (Nail).** Must be 1/2-inch, or over, in diameter and free from metal, rags, rope and cotton-covered hose.

16.—**Large Hose (Over).** Large hose must be one inch or over in diameter. Must be free from metal, rags, rope, hard or oxidized hose and cotton-covered hose.

17.—**Cotton-Covered Fire Hose (Park).** Must be rubber lined and free from hard or oxidized hose, and metal.

18.—**No. 1 Auto Inner Tubes (Quiz).** Must be strictly pure gum, live floating tubes, free from crusty tubes, cloth, metal, red and cloth patches, and free of black floating tubes.

19.—**No. 2 Auto Inner Tubes (Known as Compound Tubes) (Race).** Must be standard tubes, free from crusty tubes, cloth, metal, and cloth patches.

20.—**Red Auto Inner Tubes (Utee).** Must be standard tubes, free from punchings, crusty tubes, cloth, metal and cloth patches.

21.—**No. 1 White Rubber (Iase).** Must consist of strictly clean white soft druggists' sundries and must be free from cloth and metal.

22.—**No. 2 White Rubber (Hoard).** Must consist of white mechanical rubber and to be free from cloth, metal, crusty, hard or oxidized material, white soles and heels, jar rings and cement wringers.

23.—**Mixed Black Rubber (Yale).** Must be free from cloth, metal, crusty, hard or oxidized material, packing, stripped matting, lining, baby carriage tires, soles and heels.

24.—**Mattings and Packing (Yarn).** Must be free from Garlock, Crandall, and piston packing, belting and similar material, metal and hard or oxidized stock.

25.—**No. 1 Red Rubber (Yeast).** Must consist of soft mechanical rubber. Must be free from maroon, chocolate, and other dark shades, also free from cloth and metal.

26.—**No. 2 Red Rubber (Jar).** Must be free from non-pneumatic or filled tires, heavy worn jar rings, packing, hard or oxidized rubber, cloth, metal, soles and heels, and maroon and chocolate colored materials.

27.—**Red Packing (Zero).** Must be free from hard or oxidized rubber, cloth and metal and discolored rubber and free from graphic packing.

War Department Specifications for Mechanical Rubber Goods—III.*

WAR DEPARTMENT SPECIFICATIONS No. 333-1-1, frequently referred to in the following specifications, were published in *THE INDIA RUBBER WORLD* January 1, 1920.

RUBBER TRANSMISSION BELTING.

War Department Specification, No. 333-3-1—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR No. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for friction surface rubber belting to be used for power transmission.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods¹, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Seam in outside ply shall be filled with a rubber cord or breading, fastened down with a rubber cover strip about one-half inch wide.

BRANDING.—See General Specifications.

(a) Use word "Transmission."

MATERIAL.—See General Specifications.

(a) Cotton duck shall weigh at least 27.4 ounces per square yard.

INSPECTION.—See General Specifications.

(a) Inspector shall cut sample 12 inches long from belts four inches or under in width, four inches long from belts above four inches in width, from each roll of belting.

TESTS.—See General Specifications.

(a) **FABRIC.**—The warp must show a tensile strength not less than 250 pounds and the filler 170 pounds.

(b) **FRICTION.**—The friction shall be determined by stripping off two plies and separating them at the rate of one inch per minute. Additional test specimens shall be used for the alternate plies until all plies are tested. The average of all plies to be considered the friction strength, which shall not be less than 18 pounds for belting four inches wide and over and 17 pounds for belts less than four inches wide.

BALATA BELTING.

War Department Specification, No. 333-3-2—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR No. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for balata belting to be used for power transmission, elevator, and conveyor up to a temperature not exceeding 110 degrees F.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods¹, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) The duck shall be thoroughly impregnated with balata.

BRANDING.—See General Specifications.

(a) Use the word "Balata." Brand with stencil.

MATERIAL.—See General Specifications.

(a) Cotton duck shall weigh not less than 29 ounces per square yard and have not less than 8-ply warp yarn and 5-ply filling yarn.

(b) The impregnating material shall be chemically neutral in character, permanently pliable, and free from any substance injurious to the untreated fabric, and unaffected by exposure to atmospheric conditions and water.

INSPECTION.—See General Specifications.

(a) Inspector shall cut off sample 12 inches long from belts four inches or under in width, four inches long from belts above four inches in width, from each roll of belting.

TESTS.—See General Specifications.

(a) **FABRIC.**—(a) The untreated duck shall have a tensile strength of at least 250 pounds in the warp and 200 pounds in the filling.

(b) The adhesion between the plies of fabric shall be determined by separating two plies at a time at the rate of one inch per minute. Additional test specimens shall be used for the alternate plies until all plies are tested. The average of all plies to be considered the adhesion strength, which shall be at least 12 pounds.

CORRUGATED TENDER HOSE.

War Department Specification, No. 333-1-15—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR No. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for hose for conducting water between tender and locomotive.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods¹, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Dimensions to conform with the following table.

(b) Made of an inner rubber tube; two plies of duck; a coil of galvanized or copper-plated wire extending within three inches of end of hose and thoroughly embedded in at least a 1/32-inch layer of rubber of same compound as tube; two plies of duck; and an outer rubber cover.

BRANDING.—See General Specifications.

(a) Use word "Tender."

MATERIAL.—See General Specifications and following table.

(a) Tube and friction shall be made of a rubber compound best adapted to resist the continued action of hot water and steam; the cover to resist water; abrasion, and other mechanical injuries.

INSPECTION.—See General Specifications.

(a) Inspector may select at random for tests one length from each and every shipment of 100 lengths or less. Tests shall be performed on samples taken from soft ends.

(b) If samples corresponding to any one lot fail to meet the requirements, the contracting officer may reject that lot or may, with the consent of the contractor, accept part or all of it at not more than 75 per cent of the contract price. Provided, however, that it does not fall below by more than 10 per cent of the requirements.

TESTS.—See General Specifications and following table.

RADIATOR HOSE.

War Department Specification, No. 333-1-6—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR No. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for hose to be used between radiator and engine.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods¹, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Dimensions to conform with the following table.

(b) No couplings.

BRANDING.—See General Specifications.

(a) Use word "Radiator."

MATERIAL.—See General Specifications and following table.

(a) Tube and friction shall be composed of a steam-resisting compound; cover of an oil-resisting compound.

INSPECTION.—See General Specifications.

(a) Inspector may select at random four 3-foot sections from each and every shipment of 2,000 feet or less. Two samples to be used for steaming, two for oil tests.

TESTS.—See General Specifications and following table.

(a) Test specimens shall not be buffed.

(b) In calculating the tensile strength after steaming and oil tests, the thickness of test specimen shall be considered as equal to that of the original test specimens.

(c) **STEAMING.**—Steam at 45 pounds pressure to be passed through a 2-foot section for eight hours. (Hose to be provided with open drain cocks to prevent filling with condensation.)

*Continued from *THE INDIA RUBBER WORLD*, July 1, 1920, pages 649-651.
¹See *THE INDIA RUBBER WORLD*, January 1, 1920, page 214.

(d) OIL.—One-foot section, with both ends plugged, shall be immersed for 48 hours in medium gas engine cylinder oil between 70 degrees and 80 degrees F. and immediately wiped clean before resting. Test pieces to be cut at least four inches from either end.

TABLE.

Thickness:	Size, as Specified.
Tube, minimum	$\frac{3}{16}$ inch
Cover, minimum	$\frac{3}{16}$ inch
Tensile:	
Original tube and cover, minimum	pounds 600
After steaming tube, minimum	400
After immersed in oil, cover, minimum	400
Ultimate elongation:	
Original tube and cover, minimum	inches 2-6
After steaming tube, minimum	2-5
After immersed in oil, cover, minimum	2-5
Friction:	
Before steaming, minimum	pounds 15
After steaming, minimum	10
Fabric:	
Weight per square yard, minimum	ounces 10.8
Number of plies 2 inches and under, minimum	3
Number of plies over 2 inches, minimum	4

DIVERS' HOSE.

War Department Specification, No. 333-1-6—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for hose to be used for conducting air in diving apparatus.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) The cotton reinforcement shall consist of three braided layers, well embedded in the rubber compound to meet all tests described below.

(b) Dimensions to conform with the following table.

(c) The washers shall be of leather, 1/16-inch in thickness.

(d) Each length shall have a rubber cap at least 1/16-inch thick.

BRANDING.—See General Specifications.

(a) Use the word "Divers."

MATERIAL.—See General Specifications.

(a) Tube and cover shall contain not less than 30 per cent fine Para rubber, not more than 2½ per cent sulphur, nor more than 1½ per cent waxy hydrocarbon, with the remainder suitable dry, inorganic mineral fillers.

INSPECTION.—See General Specifications.

(a) The inspector shall cut a 3-foot section from one length out of every lot of ten (50-foot lengths) or less; or take one in every 50 short lengths for test.

(b) For each lot of fifty 3-foot lengths one extra length shall be furnished for test purposes.

TESTS.—See General Specifications.

(a) To conform with the following table.

(b) Constricted part of test specimen shall be ¼ by two inches.

	Size, ½-inch.
O. D. lengths	1½ inches, 3 or 50 feet.
Hydrostatic for couplings	2,500 pounds for 10 minutes.
Tests: burst	1,000 pounds.
Friction	20 pounds.
Tensile:	
Tube	1,200 pounds.
Cover	1,000 pounds.
Ultimate elongation:	
Tube	2 to 9 inches.
Cover	2 to 9 inches.
Stretch	2 to 7 inches.
Set	25 per cent (maximum).
Tolerance, plus or minus	$\frac{1}{32}$ -inch.

CHEMICAL ENGINE HOSE.

War Department Specification, No. 333-1-5—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for chemical engine hose for use with hand chemical fire extinguishers, and chemical engines.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Dimensions to conform with the following table.

BRANDING.—See General Specifications.

(a) Branding to be black.

(b) Use the word "Chemical."

MATERIAL.—See General Specifications.

(a) Tube, cover, washers, and friction shall contain not less than 35 per cent fine Para and not more than 3 per cent sulphur; the remainder to consist of suitable dry inorganic mineral fillers. The use of carbonates will not be permitted.

(b) Cover shall be red.

INSPECTION.—See General Specifications.

TESTS.—See General Specifications and following table.

(a) Test pieces of tube and cover shall be subjected to an accelerated aging test of 96 hours in dry heat at 158 degrees F., plus or minus 2 degrees.

TABLE.

	Size:	3/4-Inch.	1/2-Inch.	3/4-Inch.	1-Inch.

GAS HOSE.

(A) ACETYLENE-HYDROGEN HOSE. (B) OXYGEN HOSE.

War Department Specification, No. 333-1-2—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for hose to be used in carrying acetylene, oxygen, and hydrogen gas.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

(a) DIMENSIONS.—See the following table.

(b) Rubber cover shall be red for acetylene-hydrogen hose; black for oxygen hose.

BRANDING.—See General Specifications.

(a) The red covered hose shall have black brands.

(b) For acetylene-hydrogen hose use the letters "ACET-HYD:" for oxygen the letters "OXY."

MATERIAL.—See General Specifications.

(a) The fabric plies shall be of sheeting or a plain weave fabric.

INSPECTION.—See General Specifications.

TESTS.—See General Specifications and following table.

TABLE.

	Size:	Inches ½, plus or minus 1/32	¾, plus or minus 1/32

DREDGING SLEEVES.

War Department Specification, No. 333-1-4—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for dredging sleeves to be used on hydraulic dredges.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Sleeves shall consist of a rubber tube, cotton canvas layers, and rubber cover.

(b) Between the center plies there shall be a 1/32-inch layer of rubber compound. See General Specification.

(c) Ends to be capped with same rubber compound as in the tube.

²See THE INDIA RUBBER WORLD, January 1, 1920, page 214.

(d) Over the rubber cover for a distance of six inches from each end there shall be vulcanized a strip of duck same as that used in canvas layers.

(e) DIMENSIONS.—See the following table.

BRANDING.—See General Specifications.

(a) Use words "Dredging Sleeves."

MATERIAL.—See General Specifications.

(a) Cotton canvas layers shall be made from duck weighing not less than 30 ounces per square yard and containing not less than 13 nor more than 20 yarns per inch each in warp and filling.

INSPECTION.—See General Specifications.

(a) With each lot of 10 sleeves or less the manufacturer shall provide the inspector for test a sample $1\frac{1}{2}$ inches wide of same material and construction, made up with the sleeve, at one end, but detached so as not to impair the finished sleeve. Manufacturer shall submit one lineal foot of unfriictioned duck with each order.

(b) If samples corresponding to any one lot of sleeves fail to meet the tests, the contracting officer may reject the lot or may, with the consent of the contractor, accept part or all of it at not more than 75 per cent of the contract price, provided, however, that it does not fall below by more than 10 per cent of the test.

TESTS.—See General Specifications and following table.

(a) Test specimens of tube shall be buffed down to approximately $\frac{1}{8}$ -inch.

TABLE.

Size and Length, as Specified in Proposal.

RED SHEET PACKING.

War Department Specification, No. 333-2-3—June 6, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for red sheet packing to be used in joints in connection with cold water, hot water, and steam up to and including 150 pounds pressure.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Packing shall be in rolls about 36 inches wide, approximately 125 pounds in weight and of thickness specified.

BRANDING.—See General Specifications.

(a) Use the words "Red Sheet."

MATERIALS.—See General Specifications.

(a) Packing shall be of a specific gravity not less than 1.8 nor more than 2.2, which is equivalent to not less than 265 pounds nor more than 3.23 pounds per square yard for each 1/32-inch of thickness.

INSPECTION.—See General Specifications.

TESTS.—See General Specifications.

(a) Tensile specimens may be taken in any direction.

(b) Tensile strength, minimum, 500 pounds.

Ultimate elongation, minimum, two to four inches.

Ultimate elongation, maximum, two to seven inches.

(c) Packing shall not crack when bent double in any direction.

(d) A section of packing shall be cut in the form of a gasket such that it will entirely cover the seat of a 2-inch flange of an autoclave. A steel plate the size of the flange shall then be securely clamped over the gasket. It shall then be exposed to a steam pressure of 250 pounds per square inch for four hours.

After the sample has been removed from the flange of the autoclave it shall be allowed to cool for one hour, after which packing under 1/8-inch thick shall not crack if bent double in any direction and packing 1/8-inch and over in thickness shall not crack if bent around a 1/2-inch round mandrel.

TUCK'S PACKING.

War Department Specification, No. 333-2-4—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This packing is to be used as stuffing-box packing on pistons in pumps and engines.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) Tuck's packing shall consist of frictioned cotton canvas layers either round or square, as specified. The round packing shall be made with a rubber core, unless otherwise specified.

(b) It shall be built up on the bias and shall conform in dimensions, plies, and textures to the following table:

Sizes.	$\frac{1}{4}$ to $\frac{3}{8}$ -inch.	$\frac{1}{2}$ to $\frac{3}{4}$ -inch.	1 inch and over.
Texture of plies.....	Fine.....	Medium.....	Coarse
Number of plies per inch, including friction.....	38 to 42.....	26 to 30.....	15 to 17.

(c) The rubber core shall have a diameter equal to one-third the diameter of packing.

BRANDING.—Not required.

MATERIALS.—See General Specifications.

(a) The rubber core shall contain not less than 35 per cent fine Para rubber; not more than three per cent sulphur, and the remainder shall consist of suitable dry inorganic mineral fillers.

(b) Friction shall be of such a compound as to meet required tests.

INSPECTION.—See General Specifications.

(a) A section 6 inches long shall be cut from any length at any place to allow for four or more tests.

TESTS.—See General Specifications.

(a) The completed article shall withstand boiling in water under 80 pounds' steam pressure for four hours without loosening the friction or materially hardening the rubber.

(b) Packing shall be sufficiently flexible to admit of bending easily around rods or pistons of various sizes. The 1/4 to 3/4-inch shall bend around its diameter, the 7/8 to 1 1/8-inch around twice its diameter, and the larger sizes around three times their diameter.

(c) Friction shall be such that a weight of 8 pounds shall not cause a separation greater than 1 inch per minute, calculated upon a basis of a 1-inch specimen.

(d) Tensile strength of the rubber core shall be at least 900 pounds per square inch, and it shall have an elongation at the breaking point of at least two to eight inches.

DIAPHRAGM PACKING.

War Department Specification, No. 333-2-2—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This packing is to be used for making diaphragms for diaphragm pumps.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) The packing shall be in sheets approximately 36 inches wide and made into rolls of about 125 pounds each. It shall be constructed of two layers of cotton fabric using a layer of rubber between them and a layer of rubber on each side, making alternate layers of rubber and fabric.

The rubber layer which separates the plies of duck shall be 1/16-inch thick. The outer rubber layers shall be equal in thickness, but of such a thickness to make the total thickness of the packing 1/4-inch.

(b) The cotton canvas plies shall be frictioned on both sides with the same quality material as used in the rubber compound and shall withstand the friction test mentioned below.

BRANDING.—See General Specifications.

(a) Use the word "Diaphragm."

²See THE INDIA RUBBER WORLD, January 1, 1920, page 214.

MATERIAL.—See General Specifications.

(a) Fabric shall weigh not less than 12 ounces per square yard.

(b) The rubber compound shall contain not less than 40 per cent of fine Para; not more than 3 1/2 per cent sulphur; remainder to be suitable dry inorganic mineral fillers.

INSPECTION.—See General Specifications.

TESTS.—See General Specifications.

- (a) Fabric, minimum
- | | | |
|---------------------------------------|-------|--------------------|
| Warp | | 125 pounds |
| Filling | | 125 pounds |
| Yards per inch each, warp and filling | | 25 plus or minus 4 |
- (b) Friction, minimum.....14 pounds.
- (c) Tensile rubber layers, minimum.....1,800 pounds.
- (d) Ultimate elongation, minimum.....to 11 inches.
- (e) Permanent set
- | | | |
|-------------------------------------|-------|----------------|
| Stretch for 10 minutes, minimum | | 2 to 9 inches. |
| Set after 10 minutes' rest, maximum | | 25 per cent |

CLOTH INSERTION RUBBER PACKING.

War Department Specification No. 333-1—June 8, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers requirements for grade I packing used in flanges of ventilation systems or in flanges in contact with cold water which are separated only at long intervals; grade II packing used in flanges in contact with cold water which are separated frequently.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) To consist of alternate layers of rubber and cotton sheeting or a plain weave fabric in such a manner that both faces of packing shall be of rubber.

(b) Made about 36 inches wide, and in rolls weighing approximately 125 pounds, unless otherwise specified.

(c) Cotton insertion shall be properly frictioned with a composition to meet required tests.

(d) For every 1/16-inch thickness there shall be at least one ply of cotton sheeting or a plain weave fabric.

(e) 1/32-inch packing shall have only one ply of insertion and shall be furnished in grade II only. Grade I shall be furnished in thickness 1/16-inch and above.

BRANDING.—See General Specifications.

(a) Use the words "Water, Grade I" or "Water, Grade II," as specified in proposal.

MATERIALS.—See General Specifications.

(a) Fabric to weigh not less than 4.75 ounces no more than 5.15 pounds per square yard, count to be 35 to 50 threads per inch for both warp and filling directions.

(b) All rubber layers to be of the same composition.

INSPECTION.—See General Specifications.

TESTS.—See General Specifications.

- (a) GRADE I:
- | | | | |
|--|-------|----------|-------|
| Friction adhesion between rubber layers and fabric insertions, minimum | | pounds | 7 |
| Tensile of rubber layers, minimum | | | 1,000 |
| Ultimate elongation, minimum | | inches | 2-11 |
| Permanent set | | | |
| Stretch for 10 minutes, minimum | | | 2-10 |
| Set after 10 minutes' rest, maximum | | per cent | 20 |

(b) GRADE II.—One-sixteenth-inch complete packing shall weigh not less than five or more than six pounds per square yard, and other thicknesses in same proportion. Packing weighing over six pounds per square yard may be rejected, or accepted with payments based on area corresponding to 6 pounds per square yard.

Shall be pliable enough to stand bending double in any direction without cracking.

A 4-inch square of packing shall be placed in the water of an autoclave. Another section shall be placed on flange of autoclave with steel plate clamped on so as to cover the entire pieces of packing. The autoclave shall be heated to give an internal steam pressure of 50 pounds per square inch for four hours. Both sections shall be allowed to rest one hour after removing from autoclave, after which they shall show no blisters or other apparent injury. Packing under 1/8-inch thick shall not crack when bent double; packing 1/8-inch and over in thickness shall not crack when bent around 1/4-inch round mandrel.

RUBBER VALVES.

War Department Specification No. 335-1-2—June 5, 1919.

(AUTHORITY OF SUPPLY CIRCULAR NO. 8, P. S. & T. DIV., JANUARY 24, 1919.)

GENERAL.—(a) This specification covers the requirements for valves used in pumps, condensers, etc.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods², which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) The valve surfaces shall be smooth and free from pitting, air checks, other imperfections, and properly finished. They shall be hard, medium, and soft, as required.

BRANDING.—See General Specifications.

(a) Valves shall be molded with the words "U. S. A.," "Hard," "Medium," or "Soft," manufacturer's name, and date on edge of valve.

MATERIAL.—See General Specifications.

(a) Valves shall be made from a compound containing fine Para rubber, sulphur, and suitable dry inorganic fillers, as specified in table below:

	Minimum percentage fine Para.	Total sulphur.	Specific gravity.	
			Minimum.	Maximum.
Hard	30	10	1.7	1.9
Medium	35	5	1.4	1.8
Soft	35	2.5	1.6	1.8

INSPECTION.—See General Specifications.

(a) Inspector shall select one valve from every lot for tests.

TESTS.—See General Specifications.

(a) Half a valve taken at random from the lot shall stand a dry-heat test 270 degrees F. for one hour; the other half from same valve shall stand a dry saturated steam test of 400 degrees F. for three hours. The valves shall not disintegrate nor blister in either of the above tests.

SOLIDS PLUS PNEUMATICS.

Commenting on a caption of frequent occurrence in motor papers, F. R. Fageol, of the Fageol Motors Co., Oakland, California, asserts in "Automotive Industries" that it should read "Solids Plus Pneumatics" rather than "Solids vs. Pneumatics." Pointing out that both types of tires have their own peculiar functions, and that both are undoubtedly here to stay, he very aptly asserts that pneumatic tires will not run solids out of business, but will simply run trucks into more business. At present and apparently for some time to come pneumatics can no more displace solids than can trains displace boats.

From the truck manufacturer's point of view, pneumatics merely extend the range of truck transportation beyond the field developed on solids. Most tire manufacturers produce both types. Thus there are occasions for comparison, but very little conflict.

For slow-moving heavy loads in congested traffic, it is hard to conceive anything more satisfactory than the solid rubber truck tire, but it will not withstand long continuous use at high speed as do pneumatics. In the past there was no need of speed in trucking, and neither trucks nor roads were built for it. With lagging transportation facilities now the most serious problem before the world, however, the efficiency of all known transportation agencies must be increased, and neither truck load nor road will withstand the shocks and vibration of high speed unless cushioned by pneumatics.

Roads are being built to meet present-day needs, and pneumatic cord tires have enabled truck manufacturers to develop transmissions and other improvements to increase speed and economical hauling radius. The modern seven-speed truck transmission, for example, gives an over-drive for speed of thirty miles an hour on the open road, together with an extremely low reduction for steep grades on unusually heavy going. Pneumatic tires also afford traction under certain unfavorable conditions that render truck operation on solids very difficult. Sand, loose dirt, and mud seem to hold no terrors for the pneumatic.

Many claims of savings in operation costs, such as fuel consumption and general repairs when pneumatics replace solids, are being made, but these are entirely beside the point. Pneumatics do increase the usefulness of the motor truck and that is the real issue. They do not supplant solids, but bring into truck range an entirely new class of business heretofore necessarily handled by some less satisfactory means.

²See THE INDIA RUBBER WORLD, January 1, 1920, page 214.

What the Rubber Chemists Are Doing.

THE COLLOIDAL VIEWPOINT OF RUBBER CHEMISTRY.¹

THIS PAPER is divided into two main topics. The first is an analysis of the mechanism by which the particles increase or decrease in size in rubber and other colloidal systems. Under this head crystallization, condensation, polymerization and coagulation will be discussed. The second topic is concerned with some applications of selective adsorption to rubber.

CRYSTALLIZATION.

For the present purpose little need be said of the process known as crystallization except with regard to a single phase of this phenomenon. For instance, when very dilute solutions of gold chloride are treated with weak reducing agents, microscopic nuclei are formed from which colloidal crystals of gold may be made to grow, if the reducing action is kept sufficiently low, so that the molecules of gold have time to become orientated on the crystal faces. Here the growth of the particles occurs by a purely crystallization process, and will cease as soon as the supply of molecular gold or reducing agent is exhausted.

CONDENSATION.

The term condensation is often employed in a somewhat loose sense. Strictly speaking it refers to an increase in the size of the particles through the agency of a chemical change, whereby two or more molecules unite by the splitting off of water or other substance. A classical example is the formation of starch from sugar according to the equation

POLYMERIZATION.

Polymerization is another well-known method involving the growth of particles. This phenomenon differs from condensation only by the fact that nothing is split off when two or more molecules unite to form a larger complex. The molecular weight of the complex is, therefore, n times that of the original substance if n represents the number of molecules that have united to form the new and larger unit. Organic chemistry is replete with examples of this kind of chemical action. For instance the change of the aldehydes into the para or meta modifications belongs in this category. From the evidence at hand it seems very probable that in polymerization the redistribution of major valencies is involved, because those substances which exhibit this property to a pronounced degree are possessed of double bonds.

It should be emphasized in connection with a discussion of condensation and polymerization that these two types of changes are essentially chemical in the strictest sense of the term. The products of these two reactions have properties very different from the original, and the alterations of properties are sudden, not gradual.

COAGULATION.

Coagulation, in contradistinction to condensation or polymerization, involves a gradual change of properties and there is no sharp line of demarcation between the original and the final substance. Unfortunately, the term is employed to designate four distinctly different physical processes.

The first of these is well illustrated by the union of the colloidal gold crystals referred to in a previous paragraph. If during the growth of these tiny crystals the process is hurried, or if an electrolyte is added to the colloidal solution, several of the tiny crystals unite by surface contact, a loose mass is formed and eventually a powder will be precipitated.

This is, of course, an irreversible process and is a typical example of coagulation. It should be noted, however, that the particles touch the surface of one another and do not flow together.

A second form of coagulation is manifested when, for example, the particles of an oil-in-water system gather together. Here the tiny droplets touch one another, flow into a larger drop which finally rises to the top or sinks to the bottom, according to the differences in the specific gravity of the two phases. This kind of coagulation is distinguished from all others in that the resulting products are two distinct, molecularly dispersed and therefore homogeneous phases. There is no colloidal oil dispersed in the water, nor yet is there any colloidal water in the oil.

A third type is exemplified by the coagulation of gelatin in a hydrosol by an excess of an electrolyte, whereby a flocculent and perhaps a somewhat stringy mass is obtained. It is conceded by most writers that the electrolyte to a large extent desolvates the gelatin, that the particles are at first actually reduced in size because of the loss of solvent, but that the desolvated particles unite to form larger clumps which appear as flocks.

There is also another possibility that should not be overlooked. Not only may the particles unite and flow together, but the molecules of which these particles are composed may unite chemically to some extent and form a polymerized substance. In such a case we should have both a chemical and physical reaction going on simultaneously or subsequently to each other. It is altogether probable that in the coagulation of rubber latex where an elastic mass is formed, there occurs both a physical union between the particles and polymerization between the molecules in these particles. It is quite conceivable that these two reactions might proceed to a different degree in the same system under slightly different conditions. If this were true we should not expect the two products to have identical properties. This may explain why two samples of raw rubber from the same latex may differ materially from each other if the conditions during coagulation are varied in the two cases.

GELATION.

A fourth physical change, that of gelation, is usually referred to as coagulation. When a sufficiently concentrated solution of gelatin in water is allowed to cool the entire mass sets as a gel. The process in this case is the reverse of number three previously described. As the cooling proceeds the particles become more and more solvated, the size of the particles increases until they touch one another and the gelatin eventually forms the continuous phase, while the water is now dispersed in the gelatin. This phenomenon is known as a reversal of phase. Gels may be formed by evaporating off the solvent, and here the same reversal of phase may occur. It is also not impossible that polymerization may take place during the formation of a gel by either of these processes.

CHARACTERISTICS OF GELATION.

Gelation differs from the three previously mentioned forms of coagulation because in a gel both the disperse phase and the disperse medium are coextensive throughout the entire mass. This expression is employed in preference to the term homogeneous because the latter has a well-defined thermodynamic meaning. Homogeneous solutions contain a solute in a molecular state of subdivision and exhibit a lowering of the freezing point or raising of the boiling point from which molecular weights may be calculated. Gels are coextensive

¹Published by courtesy of the American Chemical Society. Paper by Elwood B. Spear, chemical department, Massachusetts Institute of Technology, read at the St. Louis meeting, April, 1920.

in the sense that every submicroscopic portion contains both the solute and the solvent.

Cautchouc dissolved in benzol may be separated from the solvent either by the addition of acetone or by the evaporation of the benzol. In the first case a lumpy, stringy mass is obtained, doubtless because the acetone desolvates the raw rubber. In other words, the acetone robs the caoutchouc of its benzol, the particles are attracted to one another and therefore coagulate in masses or flocks. When, however, the benzol is removed slowly by evaporation the particles are forced closer and closer together as desolvation proceeds. Finally they touch, flow into one another and a single coextensive mass is formed. Just as in the case of gelatin, it is quite possible that polymerization occurs during the coagulation.

In accordance with this point of view an elastic rubber mass is a coagulum permeated with capillaries, the walls of which are made up of more or less polymerized particles of different sizes stuck together at several portions of their surfaces. If a solvent is introduced the particles become solvated and separate into submicrons that differ greatly in size. Moreover, if polymerization occurs during coagulation it naturally follows that depolymerization must take place while dissolution is in progress.

This same increase in dispersion and possibly depolymerization may be brought about by other agencies than solvents. Mechanical work and rise of temperature have this effect to a marked degree. Doubtless the function of "milling" is precisely of this nature, but whether the paramount change is chemical depolymerization or merely a physical reduction in the size of the particles cannot be decided at present. It seems very probable that both occur at the same time. It is of interest to note in this connection that a tire on the road is being constantly subjected to a milling treatment which should tend to depolymerize and decrease the size of the particles. This effect should be offset wholly or in part by a slow vulcanization in case free sulphur is present, because the temperature rise in a tire under load is often very considerable.

The subject of coagulation and the antithesis, dispersion, should not be dismissed without reference to the important part these reactions play in the preparation of such compounding materials as zinc oxide, gas black and sublimed lead. A recent article on carbon black by Perrott and Thiesen,² makes it quite clear that not only the size of the particles but also the structure is vital. Both of these are without doubt influenced by the method of preparation.

SELECTIVE ADSORPTION.

Selective adsorption, the second topic of this paper, is a colloidal conception that promises to become more and more useful as it is better understood. By the term is meant that certain substances mutually attract each other with very considerable force, although no chemical action according to the law of definite proportions may result. When the substances are microscopic in size this attraction is called adhesion, but if one or both are of colloidal dimensions the term adsorption is applied. May it not be that this phenomenon is the vital factor in the compounding of rubber? Certainly on purely chemical grounds we cannot account for the very great change of properties occasioned by the mixing of gas black with raw rubber, nor yet for the fact that oil black is not so efficacious as gas black. Selective adsorption, on the other hand, predicts very pronounced differences of behavior between substances having the identical chemical composition but a different physical structure. In order that carbon black may be adsorbed by raw rubber to the greatest

degree and with the strongest bonds, the former must be in a very fine state of division, and doubtless the particles must have a particular structure. These conditions are not met so well by the oil black as they are by the gas black.

This theory also predicts other important facts familiar to the rubber chemist. For example, it ought to be possible to substitute for carbon other substances which are in a suitable physical state. The determining factor is whether or not the compounding material and rubber mutually adsorb each other to a high degree. This is doubtless the reason that zinc oxide may be employed instead of gas black.

Many other systems are known where mutual adsorption changes the properties fundamentally. As an instance may be cited a mixture of sand and mud, or clay. Roads made of either of these materials alone are nearly impassable, but if the two are mixed in the right proportions very fair surfaces result.

CONCLUSION.

From the colloidal point of view the particles of the compounding material of a compounded vulcanized rubber mass are surrounded by a thin film of rubber. The latter is therefore the continuous phase and is held securely to the surface of the compounding material by the forces of adsorption. Not only will the rubber films offer resistance to efforts tending to deform the mass, but the particles of the compounding material hold the films of the rubber so firmly that the resistance is greatly increased. A good example of this last action is shown by the surfaces of two glass plates which have been wet and brought together. As long as the plates are not very close they can be moved across each other with ease. When, however, the surfaces are pressed together so that the water forms a thin film between them, the adsorption forces become so strong that the plates may be moved in different directions only with great difficulty.

CARBON BLACK.

The following interesting facts are taken from an address delivered before the National Association of Printing Ink Manufacturers by Godfrey L. Cabot, a well-known manufacturer of carbon black.

PRODUCTION.

The makers of carbon black are straining every nerve and have been making the utmost effort for several years to increase their output, and it has greatly increased. In 1915 The B. F. Goodrich Co. made the remarkable discovery that carbon black incorporated in rubber increased its tensile strength fifteenfold, giving it greater traction effect on a smooth and slippery pavement, less wear and afforded greater resistance to the oxidizing effect of the atmosphere than any other material yet tried for these purposes. The result was that the demand for carbon black increased more than twofold, and more than half the carbon black now made is used in the rubber trade, and the amount available is not enough to satisfy it.

Many different causes have increased the difficulties of supplying the demand for carbon black. During the war pressure was brought to bear by the Fuel Administration to divert gas from its use in the manufacture of carbon black to use for fuel, and two factories have been shut down in part by this pressure.

The great scarcity of steel, its high price and the difficulties of transportation have greatly enhanced the expense and difficulty of building black factories, and it is difficult, expensive and tedious to get such material to-day.

Many of you have probably noticed old signs on country roads that had been painted in black on a background of white lead, and this in turn on a wooden board—the white lead almost gone, the wood beneath it rotted away to a very appreciable extent, and the black lettering of the original sign standing out in bas relief by reason of its having protected the

²Journal of Industrial and Engineering Chemistry," xii, 324 (1920); THE INDIA RUBBER WORLD, June 1, 1920, 581, 582.

wood beneath it by prolonging the life of the oil with which it was mixed.

CARBON BLACK RETARDS OXIDATION.

The process of the drying of linseed oil and other drying oils is due to oxidation and is accompanied by an increase in weight. This oxidation process is more retarded by carbon black than by any other known pigment. Next to it comes lampblack, but carbon black retards the drying of paint even more than lampblack by retarding the oxidation of the oil. It seems to have a similar effect on retarding the oxidation and consequent deterioration of rubber.

INCREASES TENSILE STRENGTH OF RUBBER.

Samples of rubber compounded with carbon black have shown a tensile strength of 3,700 pounds per square inch.

COMPOSITION OF CARBON BLACK.

Carbon black is not carbon, and all analyses showing over 99 per cent of carbon in carbon black are erroneous and misleading. Probably all such analyses were based on the mere combustion of the carbon black and the assumption that everything that burned away was carbon. The lowest percentage of carbon in any competent carbon black analysis that I have ever seen was obtained in the case of the famous Peerless Black and this showed 80 per cent on the commercial substance and 85 per cent when it was dried at a temperature of 110 degrees C.

No one has yet shown what connection, if any, there is between the commercial qualities of a carbon black and its percentage of carbon; this is a very interesting field for research, well worthy of attention.

Carbon black is an amorphous mixture of hydrocarbons and other organic compounds, some of which contain oxygen, none of which have ever been isolated and of which the number is probably very great.

One important and striking fact with regard to the making of carbon black is that only a small portion of the weight of natural gas is obtainable as carbon black. It is true that by calcining gas one may obtain more soot, containing as a rule adamantane particles and amounting to 6 or 7 per cent of the weight of the gas and possibly in some instances to more than this, but the material thus obtained has never been made at a competitive price, and is unsalable at any price, owing to its poor color, deficiency of coloring power and usually the presence of grit. Nevertheless, I do not by any means maintain that this method may not ultimately become of great commercial importance. Hitherto, it has been conducted only on a small scale and at a prohibitory expense by reason of the small yield in proportion to the value of the apparatus employed and the rapid destruction of the apparatus by the methods of manufacture or the great expense of the apparatus relative to the yield.

PERCENTAGE OF RECOVERY FROM NATURAL GAS.

Thirty-three years ago the yield was believed to be from one to three pounds per thousand cubic feet, which would be less than 1/30 of the carbon content of the gas. At the present time in West Virginia from 1/20 to 1/30 of the carbon is recovered in the shape of carbon black under proper working conditions. The Louisiana gas is poor in quality and yields less than 1/30.

INFLUENCES INCREASING COST OF CARBON BLACK.

Carbon black makers have been harassed by legislation. In Louisiana such attempts have ceased after a period of activity.

In Wyoming a law has been passed forbidding the erection of carbon black factories within a certain distance from cities of a certain population, a regrettable and foolish law, which probably would not stand the decision of the Supreme Court of the United States; but, at any rate, it is a distinct deterrent to the manufacture of carbon black. In West Virginia many attempts have been made to pass adverse legislation, and a law has recently been passed taxing the transportation of natural gas, but it is not in force pending the decision of the Federal courts of last resort.

Another cause that has operated to increase the cost of carbon black is the increasing value of natural gas. For instance, at Clarksburg, West Virginia, six years ago, gas was sold to the glass makers at 4 cents a thousand. They are now paying 27 cents a thousand, and in Grafton, West Virginia, they are paying 33 cents a thousand.

CHEMICAL PATENTS. THE UNITED STATES.

PROCESS OF PREVENTING THE INNER WALLS OF RUBBER HOSE from sticking during manufacture, which consists in simultaneously applying to the inner and outer walls of an uncured inner tube a mixture of water and a powdered agent capable of being deposited upon the walls of the tube and preventing adhesion of the walls. (Frank C. Moore, Canton, Ohio. United States patent No. 1,344,143.)

PRINTING-ROLLER COMPOSITION. A resilient ink-distributing roller formed of a vulcanized composition comprising a mixture of previously vulcanized and previously unvulcanized rubbers in nearly equal proportions by weight and together constituting the greater part of the composition. (Abraham L. Freedlander, Akron, Ohio, assignor to The B. F. Goodrich Company, New York City, United States patent No. 1,344,631.)

METHOD OF TREATING FABRIC. This consists in first impregnating the fabric with an emulsified lubricating material and subsequently applying a vulcanizable plastic. (Erwin E. A. G. Meyer, assignor to Morgan & Wright—both of Detroit, Michigan. United States patent No. 1,344,645.)

INKING ROLLER FOR PRINTING PRESSES. The ingredients include, approximately, in weight, aluminum flake, two pounds; lime, one-half pound; sulphur, three and one-half pounds; magnesia, four pounds; rubber, 40 pounds, and a softening agent. (Lee La Tour and Alton F. Munnell, assignors of one-third to Warren Small, all of Omaha, Nebraska. United States patent No. 1,345,200.)

THE DOMINION OF CANADA.

PRODUCING RUBBER COMPOSITIONS AND VULCANIZING PRODUCTS. The process of forming a rubber compound which consists in adding to rubber a wet precipitate of barium sulphate, which precipitate has been formed in the presence of a colloidal gel, mixing the resultant precipitate with the rubber, drying the mix, and heating the mix with a vulcanizing agent to effect vulcanization.

The homogeneous vulcanized product formed by adding to rubber animal glue formed into a gel by water, mixing the gel with the rubber, driving off the water, and heating the resultant dry mix with a vulcanizing agent to effect vulcanization. (The Good-year Tire & Rubber Co., assignee of Robert Clifford Hartong, both of Akron, Ohio, U. S. A. Canadian patent No. 201,278.)

PLASTIC MATERIAL. A new substitute for horn, hard rubber, celluloid, etc., consisting essentially of albuminoids treated with formaldehyde and of the fine cell membranes of the emptied yeast cells. (Earnest Krause, Stęglitz, and Hans Blucher, Leipzig, both in Germany. Canadian patent No. 201,420.)

THE UNITED KINGDOM.

ARTIFICIAL RUBBER TIRE FILLING. A typical composition for the purpose indicated consists of five parts of mineral oil, such as "Valvoline," to one part protochloride of sulphur. V. Villa, 34 rue Bayard, Toulouse, France. British patent No. 141,755.)

VULCANIZING INDIA RUBBER. In the vulcanization of rubber compounds by hot air, litharge or its derivatives is replaced by an organic or inorganic reducing agent to obtain a light-colored product. Suitable agents are hydro-quinone, pyragallo, tannins, paramidophenol, glycine, trioxymethylene, and other derivatives of formaldehyde, hydrosulphites, neutral sulphites. In general, the amount of reducing agent should not exceed ten per cent of the rubber. (A. Heilbronner, 74 Boulevard Malesherbes, Paris, France. British patent No. 142,083.)

COATING MATERIALS FOR FABRICS. The material known as Turkish birdlime produced from the fruits of *cordia myxa* and

cordia latifolia, is thinned and used for proofing balloon fabrics, gas helmets, etc. The balloon fabric is composed of two sheets of thin flexible material, one or both sheets being of absorbent material. One of the sheets has applied to its outer surface a coating of rubber or waterproof varnish, and to its inner surface a thin layer of birdlime. The other sheet has a coating of rubber, etc., on the surface next to the birdlime, the other surface being left bare. (C. A. Cleghorn, Brackenside, Woburn Sands, Bedfordshire, and Gayner Pneumatic Co., 95 Cannon street, London. British patent No. 142,160.)

A TIRE FILLING MOLDED IN CYLINDRICAL FORM AND USED TO replace the ordinary inflated inner tube is formed by adding sulphur chloride (six pounds, nine ounces) to a mixture of soya bean oil (25% pounds), magnesia (two pounds), and venetian red (five ounces). The oil is cooled before admixture, to 20-32 degrees F. to moderate the reaction. To insure uniform cooling the molds are provided with tubular metal cores which are withdrawn when the composition has set and the central space is filled with a fresh quantity of composition. (W. G. Wright, 1838 Collingwood street, Vancouver, B. C., Canada. British patent No. 142,416.)

PROCESS OF MAKING HEXAMETHYLENE TETRAMINE.

Commercial ammonium carbonate is dissolved in 40 per cent formaldehyde solution, the reaction taking place readily without application of heat and with brisk evolution of carbon dioxide. The solution is evaporated to dryness on a water bath under reduced pressure, and the residue is sublimed *in vacuo* or recrystallized from absolute alcohol. To compensate for its variable composition the amount of ammonium carbonate taken should be about 10 per cent in excess of the theoretical quantity. The yield of hexamethylene tetramine is about 66 per cent of the theoretical amount. (W. Herzog, "Zeitschrift Chemie," 1920, 33, 48.)

LABORATORY APPARATUS.

THE SCHAAR UNIVERSAL ELECTRIC HEATER.

THE ILLUSTRATION shows an all-purpose electric heater that can be used as a hot-plate or for heating flasks or test tubes. As a flask heater it displaces the usual tripod or support and burner. Test tubes are heated by placing them in the perforated cylinder which fits into the center of the heater between the coils.

ELECTRIC HEATER.

To transform the heater into a hot-plate the conical top is removed and replaced with a metal disc which fits over the opening.

The heater is mounted on a solid base which can be screwed to the table. (Schaar & Co., 556 West Jackson Boulevard, Chicago, Illinois.)

SPECIFIC GRAVITY CHAINOMATIC BALANCE.

Reference to the illustration shows the general construction of this balance, advantage having been taken of the salient features of the analytical chainomatic balance, which has so revolutionized weighing in analytical chemistry. There are no loose weights to use, all weighings or determinations are accomplished by placing the sliding weight in the proper notch on the beam, and obtaining the final reading by adding weight to the beam by means of the chain.

The balance is furnished either with or without a case. In the former instance it has a sensitivity of one-tenth of a milligram. The instrument has an aluminum beam, agate bearings, glass base, spirit level, etc. The plummet displaces exactly two grams of distilled water at 15 degrees C. The enclosed ther-

mometer, carefully calibrated, ranges to 30 degrees C. The small displacement makes the balance invaluable where only

SPECIFIC GRAVITY BALANCE WITHOUT CASE.

small quantities of liquid are available. (Christian Becker, Incorporated, 92 Reade street, New York.)

MONOCHROMATIC FLAME ATTACHMENT AND TUBE SUPPORT.

A new monochromatic flame attachment adaptable to any ordinary Bunsen burner is shown in the accompanying illustration. It consists of a simple cup arrangement permitting the solution of any salt to be used.

TUBE SUPPORT.

FLAME ATTACHMENT.

A very convenient and simple stand or support for tubes is here shown. It is compact, low priced and suitable for supporting tubes of any kind and in connection with holding apparatus in place. Both of these useful laboratory accessories are marketed by the same company. (Central Scientific Co., 460 East Ohio street, Chicago, Illinois.)

FINESS AND TEXTURE OF PIGMENTS.

An unique method for testing the fineness and texture of pigments is given by H. A. Gardner in Circular No. 90 issued by the Paint Manufacturers' Association of the United States (Philadelphia).

The method of test consists in rubbing with the finger a portion of the pigment across the grooves of an Edison disk phonograph record and observing the surface under a microscope. There are 150 grooves per inch of radius on a disk record, and each groove has a radius of curvature of 0.004-inch and average depth of 0.001-inch. The feel of the pigment on the record under the finger, together with the microscopic examination, will show characteristic differences in the pigments. The number of particles per unit weight of pigment may be determined with a haemocytometer using a suspension of one gram of pigment in one liter of water containing a small amount of gelatin.

New Machines and Appliances.

IMPROVED TIRE BUILDING MACHINE.

The improved tire-building machine here shown consists of two parts, a winding and stitching unit and a tension unit, both being doweled and bolted together forming a complete machine. It is used for the manufacture of fabric tires and for smaller sizes of cord tires. The capacity of the machine is 50 to 120 carcasses in a 10-hour day with one operator.

In operation, the roll of frictioned fabric is placed in the machine and the loose end threaded over the tension rollers and applied to the core. When this revolves it pulls the fabric over the tension rollers and lays it on the core. The speed of the core is controlled by gearing on the tension rollers so that the fabric cannot be applied to the core faster than the predetermined stretch in proportion to the gears and the tension rollers. Thus, the fabric will be stretched uniformly on all cores, regardless of width or variation of any kind, and can be measured to exact length and uniformly stretched, bringing the ends together.

When the machine has completed one revolution the fabric is cut off, the splice made, and the ply stitched down on the core. The next ply is put on in the same manner and when the proper number have been applied to the core, the bead is

THE BANNER TIRE BUILDER.

placed, and the remaining plies are added and stitched down separately. The tire is then trimmed and the carcass is finished.

This machine is unique in that as soon as the fabric is cut off, all sides of the core are available for inspection or removal, and no part of the machine overhangs it, or interferes at the sides with the handling or manipulation of the core. (The Banner Machine Co., Columbiana, Ohio.)

TIRE FABRIC CLEANING MACHINE.

Vacuum cleaning has been used for some time in removing from factories dust and dirt of every character, but the direct application of air cleaning in rubber mills is comparatively recent. That the Tuec air-cleaning system is being successfully used in cleaning and renovating tire fabrics may be seen in the illustration.

This apparatus is used in connection with a stationary cleaner. The top of the fabric is cleaned in passing over the bottom tube,

and the bottom of the fabric is cleaned in passing over the top tube. The tubes are of brass and properly slotted, with adjustable cover to fit any size of fabric, up to and including 92 inches.

RENOVATING LINERS.

These tubes pass from 160 to 320 cubic feet of air per minute, thus the fabric is given an air bath, removing soapstone, lampblack and other substances adhering to the fabric. (The United Electric Co., Canton, Ohio.)

VULCANIZER FOR FACTORY DAMAGED RUBBER GOODS.

Tire manufacturers can make firsts out of factory damaged casings by using the spot vulcanizer here shown. The clamp carries a steam plate $1\frac{1}{2}$ by 3 inches and is provided with a rocking table inside the casing making it self-adjusting to any uneven thickness. It is used in footwear and druggist sundries factories and also for repairing inner tubes.

To set up the vulcanizer, run two headers along the wall, one for steam, the other for condensation. One set of headers

THE SPOT VULCANIZER.

can be used for several units placed about two feet apart. A short length of chain with a hook on the end, attached to a piece of rope from the ceiling should be provided to hold the casing in the desired position. (G. S. Andrus, Akron, Ohio.)

THE LAFAYETTE PRECISION TOOL GRINDER.

While one of its most obvious applications is on a tool-room lathe for both internal and external thread-gage grinding, this machine is also intended as a grinding machine when used on the bench, and as a grinding attachment to be applied to lathes, milling machines, shapers, planers, etc., to handle a variety of work. The grinding-wheel spindle-bearing housing has a longitudinal movement in a saddle, which in turn has a vertical movement on the column. A swivel is provided with a protractor of large radius for inclining the grinding-wheel spindle, when thread grinding, to suit the helix angle. Micrometer dials are provided for both longitudinal and vertical adjustments, making it very convenient to obtain accurate settings whenever required for precision work. This machine is designed and manufactured for grinding within 0.0001-inch, and all of its parts are interchangeable. (Lafayette Tool & Equipment Co., Lafayette, Indiana.)

**UNIVERSAL TOOL GRINDER.**

A compact, combination retreat mold and sectional vulcanizer is being introduced on the Pacific Coast that can not only cure maximum size tires, including cord tires, in its one-third-circle

RETREAD MOLD AND SECTIONAL VULCANIZER.

matrix, but with head molds, which can be supplied, sections may be vulcanized in the same mold as readily as in the ordinary sectional vulcanizer. It has a self-contained boiler, full steam-jacketed walls, and raised steam-jacketed center section to take bead molds when using it as a sectional vulcanizer. Non-heat-conducting blocks on the ends of the mold prevent the stock from flowing, blistering, or leaving a burr on the ends of a cure. The rib tread is machined in the solid casting; and, it is claimed, the retreaded tire has the appearance of a new cord tire.

**PACIFIC TIRE REPAIR MOLD.**

length is applied to the periphery of the drum shown in Fig. 1 and the cord spirally laid on the sheet by revolving the drum. When the winding is completed the composite band is severed

The complete unit includes five strong steel clamps, gas burner, steam gage, safety valve, overflow valve, filler, filler valve, spring steel pressure band, wrench, and mill hose sand bag. If desired, connections can be provided for steam plant line, or for gasoline or kerosene gas burners. (L. L. Caldwell Co., 1128 Van Nuys Building, Los Angeles, California.)

STOCK CUTTER FOR SMALL MOLDED GOODS.

Rubber manufacture requires so many different processes that machines in great variety are employed. The mechanical engineer in a modern rubber mill is keen on labor-saving machinery and does not hesitate to adopt a machine or appliance used in other trades.

A case in point is the power vertical caramel cutter shown in the accompanying illustration that will find ready use as a stock cutter for small molded goods. It will cut any width from 1/16-inch to 2 inches, the platen being automatically moved forward by a ratchet-and-pawl feed. Squares of any size may be cut by turning the cut sheet of stock and again running it through the machine. Another type of machine employs a knife that operates with a shearing cut. (Thomas Mills & Bro., Inc., Philadelphia, Pennsylvania.)

**SHEET STOCK CUTTER.****MACHINERY PATENTS.****APPARATUS FOR MAKING CARLISLE CORD TIRES.**

A band of composite material consisting of a plurality of rubberized cords is first laid in parallel contact on a sheet of uncured rubber. The rubber sheet of the correct width and

**CARLISLE CORD TIRE APPARATUS.**

When the winding is completed the composite band is severed

by a bias cut and removed from the drum to the table shown in Fig. 2. Here the ends are trimmed and guide lines marked on the band at the desired angle and correct distance apart by means of a straight-edge and guide pins. The lines indicate the points where the band is to be alternately folded around the bead rings.

The band is then spirally wound upon and between two annular bead rings held in parallel position in the building stand shown in Fig. 3, the band being passed back and forth between, and over and around the rings with the exposed surface of the rubber sheet facing inwardly in the outer layer and outwardly in the inner layer. In the same way, a second band may be applied between the convolutions of the first band, and its interior surface covered by a sheet of rubber stock.

The completed carcass shown in Fig. 4 is then shaped on an air bag as seen in Fig. 5, or an ordinary core and finally completed and cured in the usual manner. (Fred B. Carlisle, Andover, Massachusetts, assignor to Joseph M. Gilbert, New York City. United States patent No. 1,345,995.) Patent No. 1,345,996, granted to the same inventor and assignee, relates to an improved band-marking apparatus, and patents Nos. 1,345,994 and 1,345,996—1,345,998, inclusive, refer to the process of manufacturing tire casings with this apparatus.

REPAIRABLE AIR-BAG FOR TIRE REPAIR.

This tire repair air-bag consists of a metal frame and a cover made from two pieces of scrap inner tube covered with stockinette. It is said that this bag will eliminate the use of pads and last from forty to eighty cures. It can be quickly renewed in the following manner.

Two pieces of tube are cut the length and size of the bag desired, and one tube is drawn inside the other. The tubes are placed over the frame that is held in a vise and the ends of the tubes tied to the ends of the frame with string. Two pieces of stockinette are applied over the tubes, the end cap placed over the stockinette and tubes, and the nut is tightened. The frame is then replaced in the vise at the tightened nut, the tubes and stockinette pulled over the other end of the frame, the cap applied and the nut tightened.

This bag is made in three, three and one-half, four and one-half, and five and one-half-inch sizes. The latter two take care of five and six-inch tires, respectively. (Perpetual Air Bag Company, 2103 South Michigan avenue, Chicago, Illinois.)

PERPETUAL AIR-BAG.

ARTISTIC MOLD WORK.

By Arthur C. Squires.

THERE ARE almost as many grades of mold work as there are states in the Union. Some work is coarse and without finish. Other is in color, texture, and finish, a product of great perfection. To this last-named class belongs the molded rubber grip used on hose supporters. Goods of this sort come under the gen-

GARTER BUTTON MOLD.

eral trade term "notions." As they are sold by the dry goods trade they must, of necessity, look at least as well as the dainty fabrics that are their counter mates. Of these goods some are wholly of rubber and some of both rubber and fabric. Where the goods are to present a fine appearance, and one side shows fabric, the molding involves considerable skill and processes not usually followed. The soft rubber garter grip is of this sort and merits especial description.

Beginning with the compound: this is of an extra whiteness secured by a formula of which lithopone is the base, a little ultramarine blue being added to get a blue-white. The compound is very rich, that the soft effect of pure rubber may be attained.

From the warming mills the snow-white compound goes to a three-roll calender which applies in two operations a continuous, thin coating of the stock to both sides of a web of unleached sheeting. As the rubberized fabric finally leaves the calender it is wound up on a stock shell with a cotton liner between the gummed surfaces to prevent their sticking together.

The calendered stock is then cut into pieces conforming in width and length to the button mold, and placed in "books" for convenient handling.

The rubber button stock is of the same snow-white compound as that used for coating and sheeting, and is run through a tubing

BLEACHING TANK.

machine provided with a die conforming to the size of the button cavities in the mold. As this continuous cord is extruded from the tubing machine it is cut into small pieces of the proper size to fill exactly each mold cavity.

The 144-cavity steel button mold is originally made in three parts for convenience in the sinking, the two sections which form the rubber tab being riveted together while the third section or top plate is loose. After warming the mold slightly and dusting it with soapstone, pieces of the white button stock are inserted in

each cavity, and a full-sized sheet of the calendered sheeting stock is laid over the buttons to which it adheres. The top plate is then placed over the sheeting and the mold and its contents are ready for the cure that is effected in a vulcanizing press. After vulcanizing, the sheets containing the buttons are removed, the mold refilled, vulcanized and so on.

The next step is bleaching—that is accomplished in a wood tank containing water and chloride of lime, into which a live-steam pipe opens. The button sheets are placed in the tank and bleached by the boiling solution. After being dried by tumbling the sheets are ready for the stockinette that is to be applied to the back of the tab.

The snow-white stockinette is passed through the 3-roll calender, where it is coated on the unfinished side with a special white compound and wound up on a stock shell, no liner being required. The roll of stockinette is then placed in a slitting and rewinding machine that cuts the roll into strips, equal to the width of the button mold, and rewinds the strips on reels.

After the vulcanized button sheets have been coated on the back with a special cement they are ready to be "backed" with stockinette. This is done on a two-roll doubling machine that applies the stockinette to the backs of the button sheets, and cold cures at the same time. A wood or metal template is employed for holding the button sheet in place during this operation. A number of doubling templates can be used to good advantage.

The button sheet is now placed in the template with the buttons down, and a cold-curing solution brushed over the cemented sur-

STOCKINETTE-APPLYING MACHINE.

face of the sheet, after which the template is placed on the platen of the machine. The end of the coated stockinette strip being drawn down from the reel is passed around the pressure roller and aligned with the end of the template to which it adheres.

When the machine is operated by turning the hand wheel the template passes under the pressure roller that doubles and applies a sheet of stockinette to the button sheet. The web is severed and another template placed in the machine, and the operation repeated.

The button sheets backed with stockinette are fully cured in about 30 minutes, after which the button tabs are died out with special cutting dies and sent to the finishing department, where they are assembled.

AMES HOLDEN MCCREADY, LIMITED, MONTREAL, QUEBEC, HAS promoted N. M. Lynn, formerly manager of its Edmonton branch, to middle western sales manager, with headquarters at its Winnipeg, Manitoba, office. He will have charge of sales in the provinces of Manitoba, Saskatchewan, and Alberta, with division offices and warehouses at Winnipeg, Regina, and Edmonton, and branch offices and warehouses at Saskatoon and Calgary. In addition to the lines of shoes, canvas, felt and rubber footwear already carried, all of these warehouses will be stock and distributing points for Ames Holden tires as soon as these are on the market in sufficient quantity.

New Goods and Specialties.

A CLEVER SPONGE RUBBER DOLL.

WHAT is perhaps the newest doll is cut from sponge rubber about an inch thick, reminding the grown-ups curiously of the gingerbread doll of younger days. Inside the sponge rubber hood is the head, made of an ordinary gray rubber ball, and on this ball the features are painted—blue eyes, saucy rose-bud mouth, yellow curl, and all. There are yellow buttons, too, painted on the “dress,” and buckles on the “shoes.” Incidentally, the head is sewed to the body with light-blue yarn, and more of the same yarn is tied around the neck and wrists. The yarn is also used for sewing in the circular piece of sponge rubber that forms the back of the hood. A later development of this doll shows a small square of the sponge rubber fastened to the top of the head, instead of the hood, while the space on the back of the ball is utilized for stamping the manufacturer's patent notice. (Rees-Davis Toy & Novelty Shop, 1716 Stevens Building, Chicago, Illinois, patent owner.)

SPONGE RUBBER DOLL.

FRENCH HEEL WITH RUBBER LIFT.

A new French heel is made of aluminum with a rubber lift attached. The rubber heel pad is attached to a metal plate by means of a screw in the center. This plate prevents the rubber heel from turning and draws it tightly to the aluminum heel proper to which it is fastened. This metal plate coming between the aluminum heel and the rubber one protects the rubber one from becoming worn by the aluminum. The illustrations show the entire heel ready for attachment to a boot and the rubber lift alone with the screw-hole in the center. This novel

heel is patented by the manufacturer. (Automatic Aluminum Heel Co., 617 Albany street, Boston, Massachusetts.)

ALUMINUM FRENCH HEEL WITH RUBBER PAD.

THE GLOVE WITH RUBBER GRIPS.

On page 365 of our March issue we described and illustrated a design for a glove with circular spots of ribbed rubber inside the hand and fingers, to facilitate

the gripping of objects while the glove was being worn. A United States patent, No. 1,346,683, has now been granted on this glove. (J. N. Reynolds, Atlantic, Iowa.)

NEW BRITISH ARMY WATERPROOF.

A recent amendment to the dress regulations for officers in the British Army approves a new pattern of waterproof coat.

It is made of waterproof drab cotton twill, with two removable linings, one of fleece and one of oilskin. It is double-breasted, reaching to the knees, and has a buckled belt of the same material. Earlier patterns may be used by officers until worn out, but future provision must be of the new pattern.

RADIATOR COVER OPERATED FROM DRIVER'S SEAT.

A cover for automobile radiators that operates from the driver's seat is made of rubber-coated fabric

rubberized to the lining, thus assuring the retaining of heat and resistance to the cold in winter. The particular style illustrated is the “automatic spring shutter,” operated like a window shade from a roller which is detachably mounted on the radiator cover. This permits the easy removal of ice and adjustment of the

“NATHAN'S” AUTOMOBILE RADIATOR COVER.

spring by which the roller automatically winds up. (Nathan Novelty Manufacturing Co., 55 Fifth avenue, New York City.)

PEARSON'S TOBACCO POUCH.

What is called the “Humidizer” pouch for tobacco is made up in two styles of rubberized surface and several kinds of real leather, enabling the smoker to choose the style he likes best, according to the circumstances in which he will make most use of it.

In the rubberized styles, a specially dyed fabric and an ordinary bombazine are rubberized together and the bombazine side is given whatever coating finish is desired.

PEARSON'S “HUMIDIZER” TOBACCO POUCH.

In the leather pouch, the same double fabric above described is used as a lining and sewed to the leather.

Accordingly, the pouch may be moistened inside without any water going through to the outside. This result has been obtained as the outcome of considerable expensive experimenting to produce such a double texture fabric, coated on the outer side, which would have the necessary water resistance on the outside and sufficient water absorption on the inside. The humidifier feature of the pouch is patented and the pouch fastens with ball-and-socket snaps, as illustrated. (Pearson Products Corporation, 725 Broadway, south of 8th street, New York City.)

A WESTERN STEAM-CURING BAG.

A newly incorporated company in the Middle West is putting out a different style of steam-curing bag for vulcanizing tire repairs. It claims that the intense heat held in it cures at a uniform temperature the rubber both outside and inside, and has been in use for over three years. A larger size, to cure six, seven and eight-inch truck tires, has been perfected during the present year. This device is covered by basic patents in the United States and foreign countries, including Canada, Great Britain, France and Germany. (The Steam Bag Corporation, 1545-1547 Broadway, Denver, Colorado.)

THE "20TH CENTURY" STEAM-CURING BAG FOR TIRE REPAIRS.

Corporation, 1545-1547 Broadway,

THE FIRST CUBAN CORD TIRE.

That a representative of a Cuban tire manufacturer was in this country to investigate manufacturing processes and buy suitable machinery for the making of cord tires was noted in our news columns last month. The result is shown herewith—the first Cuban cord tire. (Compania Cubana de Zunchos y Goma—Cuban Tire & Rubber Co., Havana, Cuba.)

FIRST CUBAN CORD TIRE.

DUST CAP FOR WIRE WHEELS.

Harmonizing with the metal spokes of wire wheels, there has been designed a tire valve of nicked brass, which is also longer than the one ordinarily used on tires. This covers the entire length of the valve stem. Patent has been applied for. (A. Schrader's Son, Inc., 783 Atlantic avenue, Brooklyn, New York.)

UNIVERSAL ADJUSTABLE DUST CAP.

"PEDALGRIPS" FOR FORDS.

The number of Ford automobiles in use offers an incentive to inventive genius to develop various accessories for use with this

FORD "PEDALGRIPS."

of high-grade rubber, with a ribbed, non-slip surface and make for sure-footedness, even for women who insist on wearing high-heeled footwear when driving. These pedal pads are furnished for both transmission and brake pedals and are applied without either bolts or screws. (Stadeker Metal Specialty Co., 310 South Canal street, Chicago, Illinois.)

A DETACHABLE VACUUM CLEANER.

A convenience for cleaning the upholstery of the automobile, motorists' clothing, etc., is pictured here, which attaches to the exhaust pipe of an automobile. To it is fastened a rubber hose and to the hose an open nozzle for cleaning floor mats, heavy dirt, etc., or a brush for cleaning upholstery and clothing. The exhaust from the engine when running operates this device, which is extremely simple. (Franklin Automobile Co., Syracuse, New York.)

LA FRANCE DETACHABLE VACUUM CLEANER.

A NEW SPORT SHOE.

A new sport shoe is an oxford of white buckskin, with tan or black trimmings, and a heavy, corrugated, non-skid sole of rubber. It is designed especially for golf or general sport wear. (Norman & Bennett, Inc., 144 High street, Boston, Massachusetts.)

THE "STAR" MESSAGE SPRAY.

A new development of the shower bath spray is shown here.

One of the features that is patented is that the water sprays through holes in the metal container,

THE NEW "STAR" MESSAGE SHOWER SPRAY.

back of the applicator, instead of from the rubber prongs as in some other designs. There are six round groups of these rubber prongs arranged in a circle on the outside of the metal container, while in the center is a round piece of sponge rubber which serves as a sponge. The applicators are removable, which contributes to the sanitary qualities of this latest spray. (The Fitzgerald Manufacturing Co., Torrington, Connecticut.)

THE NEWCOMER IN CORD TIRES.

One of the newest cord tires has a rectangular tread that offers resistance in a straight line to both the side and forward skid. At the same time, it affords complete steering ease because of its continuous, unbroken road surface. The Kenyon Cord is made full oversize, with black tread and gray side walls.

It is interesting to know that the manufacturer turned to cord tires as the solution of the after-the-war problem of what to do with the big factory that made waterproof clothing for the soldiers, as well as rubberized life-saving suits and weather-proof and water-proof clothing for civilian wear, for both men and women. (C. Kenyon Co., 754 Pacific street, Brooklyn, New York.)

KENYON CORD TIRE.

Activities of The Rubber Association of America.

THERE was very little activity in Association affairs during the past month other than the usual routine matters. Division meetings were deferred until after the vacation period, and for that reason there is nothing to report at this time.

RUBBER STATISTICS FOR FIRST HALF OF 1919.

NEW YORK, August 6, 1920.

To firm members:

There are enclosed two copies of the statement embodying a summary of the returns made by rubber manufacturers and reclaimers to Questionnaire No. 101, covering the first six months of 1919.

The information presented represents totals for the number of manufacturers and reclaimers reporting the data for their companies and is submitted as an entirety without any attempt to make an estimate as to the approximate totals for all firms to whom the questionnaire was sent.

In this connection, we are much gratified to be able to direct attention to the fact that the response to Questionnaire No. 101, while slower than we hope it will be in the future, is finally considerably more complete than was the response to the previous Questionnaire, No. 100, the exact figures being 153 returns to Questionnaire No. 101 vs. 103 to Questionnaire No. 100, both out of a total of approximately 270 firms to whom each questionnaire was sent.

A new questionnaire, No. 102, covering the latter half of the year 1919 is being sent you at this time, and we wish to take this opportunity of urging that the response to this questionnaire be as prompt and complete as is possible, in order that information for the entire year may be available in the very near future.

A. L. VILES, General Manager.

THE RUBBER ASSOCIATION OF AMERICA, INC., STATISTICS COMPILED FROM QUESTIONNAIRE NO. 101, COVERING THE FIRST SIX MONTHS OF 1919.

This questionnaire was sent to 273 firms of which 163 responded and 153 reported statistics.

AVERAGE TOTAL DAILY NUMBER OF EMPLOYEES, 166,103.

	Reported by Manufacturers who also Reclaim (18).	Reported by Reclaimers Solely (10).	Totals.	Approximate Amount Scrap Used per Pound of Reclaimed Produced.
Reclaimed rubber produced from raw and cured scrap, pounds	25,861,345	57,515,312	83,376,657	1 lb., 5 oz.
Scrap rubber (including raw and cured scrap) consumed in production of reclaimed rubber, pounds	31,928,556	80,922,149	112,850,705	

NUMBER OF POUNDS OF CRUDE RUBBER CONSUMED IN THE MANUFACTURE OF RUBBER PRODUCTS AND TOTAL SALES VALUE OF SHIPMENTS OF MANUFACTURED RUBBER PRODUCTS.

Product.	Number of Pounds Crude Rubber Consumed.	Total Sales Value of Shipments of Manufactured Rubber Products.
Tires and tire sundries:		
Automobile and motor truck casings,.....	103,926,192	\$94,329,257
Automobile and motor truck tubes,.....	22,272,497	27,246,850
Solid tires,.....	11,686,767	7,889,941
Other tires and tire sundries,.....	6,523,726	6,466,243
*Total—tires and tire sundries,.....	145,538,745	\$307,403,497
Other rubber products:		
Mechanical goods,....	10,053,317	\$45,042,163
Boots and shoes,.....	14,301,480	46,617,582
Other products,.....	6,695,533	27,888,645
*Total—other rubber products,.....	31,151,003	\$127,756,611
Grand total—all products,.....	176,697,748	\$435,160,108

*NOTE.—It should be noted that the above totals of "Tires and tire sundries" and "Other rubber products" include some figures which are not shown under the various items, which is due to the fact that some of the reports received were not itemized.

QUESTIONNAIRE NO. 102.

NEW YORK, August 6, 1920.

To rubber manufacturers:

Questionnaire No. 102, in duplicate, is enclosed with the urgent request that it be given attention and the data called for therein be supplied to this office at the earliest opportunity. The information desired is that covering the second six months of 1919, to supplement the information compiled from Questionnaire No. 101, which covered the first six months of 1919, the results of that questionnaire being distributed concurrently with this.

We have frequently directed attention to the desirability of there being available accurate and comprehensive statistics covering the industry, and in view of present general conditions we believe that the value of data of this character and of the more detailed sort to which we hope this statistical work may be extended during the coming year, will be obvious to everyone.

We wish to emphasize again the fact that there is no cause for hesitancy upon the part of any member in supplying the data called for by this questionnaire, because under the arrangement with the Guaranty Trust Company, by which the work of compilation is done, none but the total figures are available to any member of the Association or its staff and there is no likelihood of the data for an individual member becoming known to others.

The questionnaire covering the first six months of 1920 will follow this in a few days, and we wish to suggest that at this time the compilation of data is especially important and we hope, therefore, that each of our members will find it possible to give the necessary attention to the preparation and transmittal of information which will enable the total figures to be distributed within the next six weeks.

A. L. VILES, General Manager.

NEW TRADE PUBLICATIONS.

THE APSLEY RUBBER CO., HUDSON, MASSACHUSETTS, HAS ISSUED its new price-lists of canvas footwear, including both its regular lines of tennis and its Ap-Sole line of summer footwear. The lists are dated August 2, 1920, and are subject to change without notice.

THE CARTOON IN ADVERTISING IS PROVING A VERY EFFECTIVE MEDIUM of pleasant publicity. Rubber and other firms have used cartoons extensively in printed advertising, but it remained for The B. F. Goodrich Rubber Co., Akron, Ohio, to apply the idea to motion pictures. These amusing cartoon episodes of Goodrich tires put the audience in an uproar, and the next instant the dealer's name and address flashes on the screen. It is the kind of advertising that brings comment as well as results.

THE BOSTON BELTING CO., 80 ELMWOOD STREET, BOSTON, MASSACHUSETTS, has issued a good-looking booklet in two colors, describing and giving prices of rubber and balata belting, hose, matting and mats, packing and molded goods. The cover design is especially interesting as it is a reproduction of an original print that was designed prior to the Civil War.

"THE JOURNAL OF THE ROYAL SOCIETY OF ARTS" (LONDON, ENGLAND), issues of February 20th and 27th, 1920, contain a very interesting paper by Sir Francis Watts, K. C. M. G., D. Sc., Imperial Commissioner of Agriculture for the British West Indies, entitled "Tropical Departments of Agriculture With Special Reference to the West Indies," which was read at a meeting of the Colonial Section of the Society held on February 3, 1920.

MARTINUS NIJHOFF, BOOKSELLER AT THE HAGUE, HOLLAND, celebrates the 300th anniversary of the settlement of Batavia by issuing a catalog of publications on the Dutch East Indies, No. 454, "Histoire Naturelle, Cultures, Médecine et Anthropologie des Indes Orientales Néerlandaises." This includes 44 publications on rubber and gutta percha. The same house has issued recently catalogs on the Dutch in the Orient before and after 1800. It also

announces the new edition of the "Encyclopaedia van Nederlandsch-Indie" in four volumes.

THE YARNALL-WARING CO., PHILADELPHIA, PENNSYLVANIA, has just issued a well illustrated and highly informative 16-page bulletin, free on request, descriptive of Yarway blow-off valves, that will be read with particular interest in certain states where boiler laws require the use of either two valves or a blow-off valve and a cock on each individual blow-off line.

THE EDITOR'S BOOK TABLE.

"THE ORGANIZATION OF INDUSTRIAL SCIENTIFIC RESEARCH." By C. E. Kenneth Mees, D.Sc., Director of the Research Laboratory, Eastman Kodak Co., Rochester, New York. First Edition. McGraw-Hill Book Co., Inc., New York and London, 1920. (Cloth, 175 pages, 5½ by 8½ inches.)

IN HIS PREFACE the author states that this book is intended as a contribution to the study of the best methods for organizing industrial research work and of the conditions under which such work should be conducted.

The author discusses the various types of research laboratories; their position in an industrial organization; their internal organization; the staff, building and direction of the work; and a chapter on the design of a research laboratory for a special industry in which costs of operation are dealt with. The book closes with a classified bibliography on the subject of research laboratories and an index of authors and of laboratories, which will doubtless be found of much assistance.

"A GERMAN-ENGLISH DICTIONARY FOR CHEMISTS." BY Austin M. Patterson, Ph.D. First Edition. John Wiley & Sons, Inc., New York. Chapman & Hall, Limited, London, 1917. (Flexible leather. 316 pages, 5 by 7 inches.)

English-speaking chemists generally will be grateful to Doctor Austin for valuable aid to them as available in this most convenient work. Particularly helpful features are the excellent introduction and the use of Roman in place of German text.

COAL HANDLING CRANE FOR RUBBER MILLS.

The coal-handling crane at the plant of the Firestone Tire & Rubber Co., Akron, Ohio, is of a semi-gantry type, one leg running on the ground and the other running along the roof of the building. The crane is equipped with a traveling man-trolley. All of the operations of the crane are con-

HANDLING COAL AT THE FIRESTONE PLANT.

trolled from the operator's cab attached to this man-trolley. In connection with this equipment a traveling coal crusher is also furnished. This crusher travels along the top of the building directly over the hopper leading to the stoker sys-

tem. The crane handles coal from car to storage and from storage to the traveling coal crusher where it is crushed and discharged into stocker. Coal may also be handled direct from cars to crushers, if desired. The crane is electrically operated, alternating current being used. The man-trolley is equipped with two drums which are operated by friction clutches and brakes, this arrangement contributing to maximum speed of operation. A two-cubic-yard bucket of the four-line type is used. (McMyler-Interstate Co., Cleveland, Ohio.)

A ROTARY SPRINKLER OF VARYING RADIUS.

A new type of lawn or garden sprinkler which fits any hose connection has been developed, illustrated herewith. It is operated by means of the pressure of the water required for sprinkling, and will spray an area ranging from 15 to 80 feet in diameter. There is a wheel with blades like a propeller, which cuts the water into drops as it revolves, while the sprinkler head rotates in a circle. The area sprinkled is regulated by turning down the faucet. The gears are enclosed, running in an oil bath, and there are no separate parts to get out of order. The machine is finished in gold bronze and carries the manufacturer's guaranty for one year of satisfactory service, or price will be refunded. (Double Rotary Sprinkler Co., Coca Cola Building, Kansas City, Missouri.)

DOUBLE ROTARY SPRINKLER.

A "MERMAID" BRUSH.

IN THE INDIA RUBBER WORLD of January 1, 1919, there was illustrated and described the "Maid-of-America" hair brush, with removable rubber cushion in which the bristles were vulcanized. The manufacturer is now putting out a similar brush called the "Mermaid," which operates in the same way. (Monarch Brush Co., Troy, New York.)

INTERESTING LETTERS FROM OUR READERS.

TREUGOLNIK NOT RUN BY GERMAN CAPITAL.

TO THE EDITOR:

DEAR SIR: On behalf of my principals, the Russian American India Rubber Co. "Treugolnik" of Petrograd, I wish to take exception to a statement namely: "The 'Treugolnik' company, before the war, was mainly run by German capital," which appeared in the last paragraph of an article written on page 533 of the May 1, 1920, issue of THE INDIA RUBBER WORLD, as the statement is not only without any foundation, whatsoever, but, appearing in your journal, it is likely to have a detrimental effect on the interests of the "Treugolnik" company.

From the fact that the article in question was written entirely in the interests of the "Treugolnik" company's largest competitor, it is possible that such incorrect information was given you for a definite purpose.

I sincerely trust that you will see your way clear to publish a contradiction in one of your next issues.

STINTON J. JONES,

For The Russian American India Rubber Co.
London, England.

News of the American Rubber Industry.

DIVIDENDS.

THE AJAX RUBBER CO., INC., has declared its quarterly dividend of \$1.50 per share, payable September 15 on common stock of record August 31, 1920.

The American Chicle Co., New York City, has declared its regular quarterly dividend of one and one-half per cent, payable October 1 on both preferred and common stock of record September 18, 1920.

The Bergougnan Rubber Corporation, Trenton, New Jersey, declared a dividend of one and three-quarters per cent, payable August 10 on preferred stock of record July 10, 1920.

The Brunswick-Balke-Collender Co., Chicago, Illinois, has declared a stock dividend of 150 per cent, on common stock, payable in new class B stock, in addition to the regular quarterly dividend of one and three-quarters per cent, which was payable August 15 on common stock of record August 5, 1920.

The Firestone Tire & Rubber Co., Akron, Ohio, declared a quarterly dividend of one and three-quarters per cent, payable August 15 on its seven per cent preferred stock of record July 31, 1920.

The General Electric Co., Schenectady, New York, has declared its quarterly dividend of \$2 per share, payable October 15, on common stock of record September 9, 1920.

The B. F. Goodrich Co., Akron, Ohio, and New York City, has declared dividends of \$1.75 and \$1.50 per share, the first payable October 1 on preferred stock of record September 21, and the second payable November 15 on common stock of record November 5, 1920.

The Goodyear Tire & Rubber Co., Akron, Ohio, has declared its quarterly dividend of two and one-half per cent, payable September 1 on common stock of record August 14, 1920.

The Lee Rubber & Tire Corporation, Conshohocken, Pennsylvania, and New York City, has declared its quarterly dividend of 50 cents per share, payable September 1 on stock of record August 14, 1920.

The Miller Rubber Co., Akron, Ohio, has declared a quarterly dividend of two per cent, payable October 1 on its new preferred stock of record September 10, 1920.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, at a meeting of the board of directors held on August 20, declared its regular quarterly dividends of one and three-quarters per cent on preferred stock and one and one-half per cent on common, both payable September 30 on stock of record September 15, 1920.

The Rubber Products Co., Barberton, Ohio, has declared its regular quarterly dividend of two per cent, payable September 1 on stock of record August 20, 1920.

The Tyer Rubber Co., Andover, Massachusetts, paid the regular quarterly dividend of \$1.50 per share on preferred stock August 15, 1920.

FINANCIAL NOTES.

Sales of The Mason Tire & Rubber Co., Kent, Ohio, for the third quarter ended July 31, 1920, were \$1,748,000, compared with \$1,011,000 for the corresponding quarter of 1919, or an increase of over 75 per cent. Sales for the first nine months of the present fiscal year amounted to \$5,200,000, compared with \$2,550,000 for the corresponding period of last year, or an increase of more than 100 per cent.

The sales of The Goodyear Tire & Rubber Co., Akron, Ohio, for the first nine months of 1920 amounted to \$162,202,467.21,

according to official announcements. The company's sales for the whole of 1919 amounted to approximately \$168,914,000. The gross sales of the company during July of the present year amounted to \$17,185,113, as compared with \$15,989,349 during the same month last year. It is estimated that the gross sales of the company will approximate \$200,000,000 this year.

As a result of the new preferred and common stock financing and of its liquidating policy the Goodyear company is reducing its loans at the banks and expects by the end of its fiscal year to have its outstanding floating debt down to modest proportions.

The Brunswick-Balke-Collender Co. reports sales for the six months ended June 30, 1920, of \$15,243,178, a gain of \$5,181,803. Net profits after all taxes amounted to \$2,309,826. Gross sales for the first half of this year were at a record rate, showing an increase of 50 per cent. Stock dividends will be paid from the new stock authorized last April. In the meantime the company sold \$3,000,000 common stock to its stockholders at par, increasing the amount actually outstanding to \$9,000,000.

The Ajax Rubber Co., Inc., report net earnings of \$1,528,634 for the six months ended June 30, 1920, equivalent to \$7.64 a share earned on the 200,000 shares of stock (\$50 par value). This compares with \$1,886,730 or \$9.43 a share in the corresponding period of 1919. Gross sales were greater in volume in the first half of this year than in any similar period of the company's history, exceeding the first six months of 1919 by about 16 per cent net. The income account for the six months ended June 30, 1920, compares as follows:

	1920	1919	1918	1917
Net earnings.....	\$1,528,634	\$1,886,730	\$1,959,608	\$1,257,461
Dividends.....	600,400	488,528	420,000	390,000
Surplus.....	\$928,634	\$1,398,202	\$1,539,608	\$867,461

*After providing \$137,871 for taxes.

Net sales of the United States Rubber Co. for the six months from January 1 to June 30, 1920, were \$129,588,986, an increase of \$30,099,615 over the corresponding period of 1919; and the net income, after deducting all interest charges and after allowing for depreciation and Federal taxes, was \$13,690,924, an increase of \$3,059,490 over the corresponding period of 1919.

The balance sheet of The B. F. Goodrich Co., as of June 30, 1920, shows as follows:

Assets: current assets, consisting of cash, bills and accounts receivable, and inventories of raw and finished stock, \$104,470,421; investments and advances to other companies, \$5,793,220, foreign associated companies, etc., \$8,802,624; deferred charges, \$1,231,813; real estate, plant, buildings and equipment, less reserves of \$9,456,892; \$27,762,228; patents and contracts, \$1; goodwill \$1; total, \$148,060,308.

Liabilities: current liabilities, \$31,902,556; 5-year 7 per cent convertible gold notes due April 1, 1925, \$30,000,000; reserves for contingencies, pensions and amortization of war facilities, \$3,759,879; preferred capital stock, \$38,412,000 (par \$100); common (no par) represented by accumulated surplus, \$43,985,873; total, \$148,060,308.

The company's net profits were \$7,000,000 before Federal taxes for the six months ended June 30, 1920, representing a decline of \$100,000 from net profits of \$7,700,000 for the corresponding period last year. At first glance this would seem to substantiate recent rumors that tire companies were doing less business. In the case of Goodrich, however, sales for the first half of this year were approximately \$20,000,000 greater than in the first six months of 1919 and the reason why profits did not show a corresponding increase is attributed to substantial increases in the costs of raw materials. The advance of from 10 per cent to 20 per cent in

the retail prices of its products put into effect last March, coupled with the fact that raw materials, especially rubber, are becoming somewhat cheaper, should result in an increased ratio of profit on sales during the balance of this year.

On estimated sales of \$90,000,000 in the first half of this year net profits, after preferred dividends but before Federal taxes, were at the annual rate of \$21.60 a share on 600,000 shares of no par value common stock. This compares with \$25.09 a share earned in 1919, the best year in the company's history.

In order to provide for expansion the International India Rubber Corporation, of South Bend, Indiana, which was incorporated for \$1,000,000 under the laws of Delaware in 1915, on February 7, 1920, increased the capital stock to \$2,500,000, by the addition of 60,000 shares, second issue, non-voting common stock of the par value of \$25 per share. The sales earnings in 1917 were \$107,333.52; in 1918, \$155,646.81; and in 1919, \$673,069.35. Up to March 1, 1920, sales were running more than 300 per cent of those for the same period of 1919 and the sales for 1920 are estimated at \$3,000,000.

RUBBER STOCK QUOTATIONS.

The following quotations on the Cleveland Stock Exchange, August 19, of stock of the principal rubber companies were supplied by Otis & Co., Cuyahoga Building, Cleveland, Ohio.

NEW INCORPORATIONS.

Bedell Inc., S. M., August 7 (New York), \$5,000. R. A. Wielsel; C. Schwartz; J. E. Zukus—all of 15 East 40th street, New York City. To manufacture tires.

Canton-Blackstone Sales Corp., The, July 28 (New York), \$60,000. A. E. Beckert, 530 West End avenue, New York City; A. J. Ewald, 36 Prospect street, White Plains—both in New York; P. A. Proal, Red Bank, New Jersey. To manufacture tires and rubber goods.

Central Rubber Reclaiming Co., The, August 1 (Ohio), \$175,000. J. F. Seaster, president; C. E. Hart, vice-president; D. E. Reynolds, secretary and treasurer. Principal office, Defiance, Ohio. To reclaim rubber.

Collapsible Rim Co., The, June 17 (North Carolina), \$300,000. W. W. Bruce; J. J. Nichols; F. L. Sale—all of Asheville, North Carolina. Principal office, Asheville, North Carolina. To manufacture and sell rims for automobile wheels.

County Seat Tire Co., Inc., August 19 (New York), \$2,000. F. Brush, 320 South Fifth avenue; C. Rosenberg, 550 South Eighth avenue, both of Mount Vernon; D. Lisow, 135 Broadway, New York City—both in New York. To repair tires.

F. & W. Tire Distributing Co., Inc., August 4 (New York), \$100,000. A. D. Ferrell; L. P. Perkins; T. E. Terry—all of Buffalo, New York. Principal office, Buffalo, New York. To distribute tires.

French & Handy, July 30 (New York), \$25,000. P. J. Ross; J. O. Perry; H. W. French—all of 25 Beaver street, New York City. To deal in crude rubber.

Gordon Co., Inc., The, H. B., July 23 (Massachusetts), \$10,000. Bernard C. Harris B. and T. Gordon—all of South Pleasant street, Sharon, Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in all kinds of rubber clothing.

Graville Tire Co., July 12 (New Jersey), \$15,000,000. F. D. Buck; C. W. Dillman; M. L. Hooley—all of Wilmington, Delaware. Principal office, 305 Ocean avenue, Jersey City, New Jersey. Agent in charge, W. George. To sell automobile tires.

Grass Tube Marine Life Saver Corp., August 13 (New York), \$25,000. H. Fitch; V. Guarnino; L. Grobning—all of 106 East 19th street, New York City. To manufacture life belts and life-saving devices.

Guaranteed Tire Filler Corp., July 27 (New York), \$50,000. J. and M. Stander; A. M. Chamow—all of 1092 President street, Brooklyn, New York. Principal office, Brooklyn, New York.

Handy Rubber Heel Co., August 9 (Massachusetts), \$100,000. W. Camuche, 31 Echo avenue, Beverly; W. Blaney, 1 Pearl street, Marblehead; J. L. McCarthy, 81 Washington street, Salem—all in Massachusetts. Principal office, Salem, Massachusetts. To manufacture rubber heels.

Hope Tire & Rubber Co., The, May 21 (Connecticut), \$20,000. B. Yarus, president and treasurer; S. Colitz, vice-president; M. H. Plainfield, secretary and general manager. Principal office, 140-142 Greylock Place, Stamford, Connecticut. To build tires.

Hopewell Insulation & Manufacturing Co., March 20 (Virginia), 7 per cent preferred, \$200,000 common. S. S. Sonneborn, president and general manager; E. A. Spengeman, vice-president; C. Branda, secretary. Principal office, Hopewell, Virginia. To manufacture hard rubber, composition rubber and all kinds of insulation products.

Hudson Tire & Rubber Corp., April 19 (New York), \$1,000,000. W. M. Doucette, president; H. E. Seymour, vice-president and treasurer; U. Wiesendanger, secretary. Principal office, 503 Proctor Building, Yonkers, New York. To manufacture and sell cord and fabric tires, etc.

International Tires Stores Corp., August 11 (Delaware), \$50,000,000. T. L. Groleau; M. A. Bruce; A. M. Hoven—all of Wilmington, Delaware. To buy, sell, and generally deal in rubber tires, tubes and accessories.

Pittsburgh Rubber Sundries Manufacturing Co., July 21 (Delaware), \$500,000. C. M. Blaske; M. A. Bruce; S. E. Dill—all of Wilmington, Delaware. To manufacture and sell rubber and rubber products.

Pneumatic Rubber Heel, Inc., August 23 (New York), \$100,000. A. Allenberg, 3 East 44th street, New York City; G. Looch, 23 18th street, Astoria, both in New York; A. Seifert, Hasbrouck Heights, New Jersey. To manufacture rubber heels.

Quality Tire Co., July 30 (New Jersey), \$50,000. J. J. Cooley, 34 Westfield avenue, Elizabeth; E. Feneane, 59 Sanhican Drive, Trenton; L. M. Ettinger, 459 High street, Newark—all in New Jersey. Principal office, 238 Halsey street, Newark, New Jersey. Agent in charge, F. J. Pfaff. To deal in automobile tires; distributor of Hood tires and tubes.

Rock Bestos Products Co., July 26 (Delaware), \$5,000,000. C. H. Blaske; M. A. Bruce; F. E. Dill—all of Wilmington, Delaware. Asbestos products.

Sabbag's Rotary Rubber Heel Co., August 3 (Massachusetts), \$50,000. L. G. Sabbag, 810 Saratoga street; N. G. Sabbag, 863 Saratoga street, both of East Boston; H. A. Kenny, 42 Morland street, Roxbury—both in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in rubber and leather heels, etc.

Seattle Asbestos Factory, April 28 (Washington), \$20,000. W. H. M. C. and John D. Chambers. Principal office, Seattle, Washington. To manufacture asbestos products.

Seabee Tire & Rubber Co., August 6 (Delaware), \$10,000,000. V. P. and M. M. Lucey; M. A. Davis—all of Wilmington, Delaware. To manufacture and deal in rubber tubes, tubes, valves, shoes, etc.

Stable Flex-Hub Wheel Co., July 21 (Massachusetts), \$100,000. W. K. Beardsley, 9 Stratford street; J. F. Moloney, 41 Peterborough street, both of Boston; J. J. Fitzpatrick, 96 Reservoir avenue, Revere—both in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in wheels and tires for automobiles; also accessories.

Thames Tire Corp., July 30 (New York), \$1,200. G. D. Smith, Bedford Centre; E. A. Jones, Nyack, both in New York; S. Richert, Atlantic Highlands. To manufacture rubber tires.

United Rubber Co., Limited, February 11 (Canada), \$1,000,000. Charles H. and Leonard L. Stanvon; William B. and Norman B. McPherson; M. D. Gray—all of Toronto, Canada. Principal office, Toronto, Canada.

Youngs Rubber Corporation, August 9 (New York), \$100,000. A. R. Chisholm, 10 West 61st street; S. A. Foote, 114 West 79th street—both of New York City; M. L. Youngs, 139 South Second street, Mount Vernon—both in New York. Principal office, 75-77 Spring street, New York City. To manufacture atomizers and molded rubber goods for the wholesale druggists' trade. Purchased business of Fay & Youngs, Inc., and of Fay & Youngs Rubber Corporation.

AMERICAN DUNLOP BUILDINGS NEARING COMPLETION.

WORK on the new Dunlop tire plant in the United States, to be operated under the name of Dunlop Tire & Rubber Co., is progressing very rapidly.

The site embraces 214 acres on River road, half a mile north of the city line, Buffalo, New York. Its location on the Niagara river insures adequate water supply and direct rail communication to all parts of the country. Electric current will come from Niagara Falls and Buffalo. Some steam power will be used, however.

The plant consists of nine factory buildings, 560 by 120 feet, and a warehouse four stories high, 546 by 162 feet, the whole providing a floor space of 30 acres. The factory buildings are one-story monitor type, of structural steel with concrete foundations, and the warehouse is of concrete. The plan shows an arrangement in groups, each of three parallel buildings so spaced that the capacity of the plant can easily be doubled by the addition of duplicate buildings. Employees will pass to their respective places through covered roadways connecting the buildings, materials and finished products being transported through the same

system. This arrangement is expected to increase the efficiency of tire manufacturing. There is a system of conduits or subways to carry water pipes, steam pipes and electric wires to all parts of the factory.

Exceedingly rapid construction is being attained, the first ground having been broken March 16; the first concrete poured April 7; the first steel erected April 26 and the roofing commenced about August 1.

An estimated capacity of 12,500 tires daily is being provided for. Cord pneumatics, including giant pneumatic truck tires and tubes, and also solid truck tires, will be made in all sizes, including Ford and motorcycle sizes. Present plans do not include the manufacture of fabric tires. Production will start very early in 1921.

A textile mill at Utica, New York, has been purchased where cord fabric for the new tire plant will be produced. In the near future a factory will probably be constructed as part of the Buffalo plant for the manufacture of Dunlop "Vac" golf balls.

Previous references in *THE INDIA RUBBER WORLD* to the new Dunlop plant have been made under the name Dunlop America Limited, which was incorporated in New York State December 5, 1919.

KENYON'S EASTERN SALES MANAGER.

FRIENDS of Franklin G. Hill, who has taken over the eastern sales management for the C. Kenyon Co., Inc., Brooklyn, New York, say that he is big enough for the job, and perhaps the biggest man in the tire trade.

As he stands six feet three inches and tips the scale at 255 pounds, none will dispute it. Quite apart from these facts, however, his experience has been such as to render him a big man in the tire trade in quite a different sense.

A native of Bradford County, Pennsylvania, where he was educated in the public schools, commercial college and normal school, graduating in 1902, he began his career in the rubber industry with the Diamond Rubber Co. in 1905. The following year he went to the Continental Caoutchouc & Gutta Percha Co., of Hanover, Germany, and in 1907 took over the eastern distribution of Republic tires and tubes, becoming vice-president of the Republic Rubber Co. of New York and also of the Petter Shock Absorber Co.

Mr. Hill resides at Freeport, Long Island, and has been active in politics for several years in Nassau County. He is an Elk and a Mason.

FRANKLIN G. HILL.

PERSONAL MENTION.

F. C. Ryan, with the New York City office of the New Jersey Zinc Co., Inc., sailed on August 11 aboard the Grace liner *Santa Ana* for Valparaiso and other South American west coast ports.

C. E. Little has been appointed New York representative of the Tru-matic Tire & Tube Co., a Delaware corporation, with office at 106 Duane street, New York City.

A. F. Bearsag has been appointed New York representative for the Netherlands Corporation for Oversea Trade, Holland, capitalized at \$5,000,000, with office at 220 Broadway, New York City.

Ernest Schulthess, a mechanical goods salesman well known in New York City, is a director in the United Tire & Export Co., 26 Cortlandt street, New York.

W. A. Brady has been promoted to the management of the New York branch of The McGraw Tire & Rubber Co., succeeding W. H. Hurley, promoted to assistant sales manager in Cleveland, Ohio.

Lloyd Appleton, for 13 years secretary of F. H. Appleton & Son, Inc., Boston, manufacturer of reclaimed rubber, and in charge of the company's New York office, recently resigned to devote himself to other interests. Mr. Appleton is very well known in the industry and many friends will miss his genial personality.

C. B. McKay, who looks after the crude rubber requirements of The Fisk Rubber Co., Chicopee Falls, Massachusetts, will leave Singapore for home about September 1.

Robert F. Whitehead has been appointed by President Wilson to the position of Commissioner of Patents of the United States, succeeding James T. Newton, who recently resigned. Melvin H. Coulston has been appointed First Assistant Commissioner of Patents. Both men have been on the staff of the Patent Office for more than eighteen years.

In Chicago recently, at a meeting of the Chemists' Club, George Slocum, who has been connected with the United States Rubber Co.'s plantations in Java and Sumatra for the last five years, gave an address on "Java and Its Rubber Plantations."

THE RUBBER TRADE IN THE EAST AND SOUTH.

By Our Regular Correspondent.

NEW YORK NOTES.

THE Braender Rubber & Tire Co., Rutherford, New Jersey, has removed its export office from 32 Broadway to 132 Nassau street, New York City.

The Prospect Tire & Rubber Co., Buffalo, New York, has increased its capital from \$500,000 to \$1,000,000.

The Holly-Wood Chemical Co., 101 Beckman street, New York City, has just been established to deal in rubber makers' chemicals, pigments, and colors. These include sulphur, zinc oxide, talc, whitening, dry colors, antimony, etc. A. P. Gottfried, widely known in chemical circles, and S. F. Demant are at the head of the company that maintains branches in Baltimore, Philadelphia, Buffalo and San Francisco.

The shipping agency business established in New York City for nearly 60 years by Booth & Co. and Booth & Co., Inc., will hereafter be carried on under the name of Booth American Shipping Corporation, with offices at the same address, 17 Battery Place, and without change of management or personnel. The company operates steamers between Amazon river ports and New York.

The United States Rubber Co., New York City, has promoted F. J. Nute, formerly salesman at Portland, Maine, to the position of branch manager in the same city.

The business of the Fay & Youngs Rubber Corporation, and of Fay & Youngs, Inc., has been purchased by a newly incorporated company, Youngs Rubber Corporation, which will have its main offices at 75-77 Spring street, New York City. The officers are: Merle L. Youngs, president and treasurer; William McKinney, vice-president; and Jesse A. Cole, secretary. These are also directors, besides Messrs. John E. Conklin, Samuel A. Foote, A. R. Chisholm, and R. R. Carter. The company will manufacture atomizers and molded rubber goods for the wholesale druggists' trade.

The Multiestos Co., Walpole, Massachusetts, has established a branch office at 105 West 63d street, New York City, with Mr. Schacht as manager.

The Philadelphia Rubber Works Co., Akron, Ohio, has purchased a 100-acre tract of land adjoining the property of Dunlop

America Limited in Buffalo, New York, but will not develop the premises at present.

Jean Nehmelman has been appointed sales manager of Madison Tire & Rubber Co., Inc., New York. Sylvan E. Weil will continue as assistant sales manager. George Shortmeier has been appointed manager of the New York branch. All have been connected with the company since its inception.

The College Point Rubber Mold & Engraving Co., College Point, New York, has changed its name to "College Point Mold, Die Sinking and Engraving Co."

L. Littlejohn & Co., Inc., crude rubber importers, has removed its offices from No. 138 to Nos. 133-137 Front street, New York city.

Elbert & Co., dealers in oils, including cotton, coconut, palm, and copra, removed several months ago from 71 Wall street to 27 William street, New York City.

The Gordon Suspender Co., New Rochelle, New York, has increased its capital stock to the following: 150 shares preferred, par value \$100; 150 shares common, no par value; \$15,750 to carry on business.

CONNECTICUT NOTES.

The Seamless Rubber Co., New Haven, Connecticut, has purchased the dipped goods department of The Miller Rubber Co., Akron, Ohio, including household, surgeons' and acid rubber gloves, finger cots, dipped bathing caps styles Nos. 357 and 358, drainage gauze covers, dilator covers, and toy balloons.

The United States Rubber Co., New York City, has promoted L. W. Jerauld, formerly salesman in Boston, to the position of branch manager at the Hartford Rubber Works, Hartford, Connecticut.

Goodyear Cotton Mills, Inc., Goodyear, Connecticut, has canceled operations looking to the immediate building of a 500-foot spinning mill, and the structure will not be erected until some future date.

PENNSYLVANIA NOTES.

George W. Kavanaugh, Inc., manufacturer of fabrics for the rubber trade, has removed from 216 Chestnut street to 38 North Second street, Philadelphia, Pennsylvania.

The officers of the Prudential Tire & Rubber Co., 816 Commerce Building, Erie, Pennsylvania, include Fred A. Seiberling, president, and D. L. Stouch, secretary and treasurer.

The Southwark Foundry & Machine Co., Philadelphia, Pennsylvania, has increased its sales engineering staff by the addition of James T. Lee, formerly vice-president in charge of sales of the Hanna Engineering Works, Chicago, Illinois. The Southwark company is planning to add a full line of pneumatic and hydro-pneumatic riveters and foundry molding machines to its present line of hydraulic and power machinery, and thereby broaden its field of activity.

SOUTHERN NOTES.

The Continental Tire & Rubber Co., Gulfport, Mississippi, is now receiving machinery for its factory and expects to be in operation by October.

Fred B. Geary has been appointed branch manager of the Madison Tire & Rubber Co., New York City, with headquarters at 303 Peachtree street, Atlanta, Georgia.

The Delion Tire & Rubber Co., Baltimore, Maryland, has purchased the plant and equipment of The Dreadnaught Tire & Rubber Co. of the same city and will make extensive alterations and improvements. Considerable new machinery will be installed and it is expected that the plant will be in operation about the middle of November, producing Delion tires and tubes. The officers of the company are: John W. Price, president; W. C. Price, vice-president in charge of sales; R. B. Arnold, vice-president in charge of manufacture; and R. L. Swats, sales manager.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON TIRE MANUFACTURERS are experiencing a little slump in the tire market at the present time. This unusual condition is due principally to transportation difficulties. Owing to the shortage of freight cars the automobile manufacturers have been unable to secure needed materials, and were compelled to cancel orders for thousands of tires. As soon as this situation is remedied rubber manufacturers expect to receive large orders for tires and tubes. Business in the mechanical rubber goods trade has been very good for some time and manufacturers expect it to continue.

The Ajax Rubber Co. was the only Trenton concern forced to lay off a number of employees because of these conditions. The company has laid off about 250 tire makers, but according to officials of the company they will be put back to work within a short time. It is not thought by heads of other rubber concerns in Trenton that the situation will grow any worse in this section.

Two more Trenton rubber concerns have decided to enlarge their plants to take care of future trade. The Thermoid Rubber Co., which recently let a contract for a big addition to the plant in Hamilton township, will erect an additional story to the main plant. The new story will be 80 by 200 feet, of reinforced concrete and steel, and will cost \$50,000. The Hamilton Rubber Manufacturing Co. will build a two-story addition to the plant on Mead street. The building will be 20 by 40 feet of brick and steel and will cost \$15,000. The Joseph Stokes Rubber Co. has completed the erection of a steel water tank of 70,000 gallons capacity with a 125-foot tower. The Acme Rubber Manufacturing Co. recently let a contract for a big addition, and the Ajax Rubber Co. recently completed large additions.

The employees of the Essex Rubber Co. and the members of their families, numbering approximately 500, held an annual outing at Burlington Island Park recently. The rubber plant was closed for the day and the trip was made on a steamer on the Delaware River. There were various field and aquatic sports.

Some of the rubber factories of Trenton have suffered heavy losses through systematic thefts of tires during the past year and the police of Trenton now believe that they have put a stop to these wholesale robberies by the arrest of several young men. The Empire Rubber Co. alone lost nearly \$3,000 worth of tires. How the tires were taken from the plants is a mystery. A tire concern at Perth Amboy, where the stolen goods were sold, was raided by the police and the proprietors arrested. The tires stolen were of the best grade and easily disposed of at the "fence" raided by the police.

The United & Globe Rubber Co. recently completed the erection of a new tower and steel tank with a capacity of 100,000 gallons of water. This is in addition to the company's other tanks and will give better service in case of fires in the future.

The Temple Rubber Co., Trenton, is completing a big order for tires for European dealers and expects more orders from abroad during the coming fall.

The Bergougnan Rubber Corporation, Trenton, New Jersey, has practically completed its plant additions which have been under construction for a number of months. These consist of a two-story unit of the same size and type as the other two main units of the plant, a warehouse, a rubber cement mixing and storage building, a machine shop, a carpenter shop, and a large garage and repair shop for motor trucks and passenger cars. The sidings which connect with the Pennsylvania railroad are also being improved as well as the facilities for handling and storing coal.

The Acme Rubber Manufacturing Co., Trenton, has broken ground for a new factory building, 90 by 300 feet, to be used

entirely for the manufacture of molded hose. It will be of concrete and steel construction and the company hopes to occupy it by November 1.

Capitalization of the Joseph Stokes Rubber Co., of Trenton, New Jersey, has been increased from \$300,000 to \$5,050,000 by the filing of a certificate with the Secretary of State amending the charter of the company. This increase in the capital of the Stokes company is in line with expansion of the business, which has grown tremendously in the last few years. The company recently purchased several properties on Taylor street for eventual plant extension. A modern office building is now being erected.

Harry Weida, vice-president of the India Rubber Co., New Brunswick, New Jersey, recently entertained the members of the office force with a motor trip to Asbury Park and other points along the New Jersey coast. The guests also enjoyed a shore dinner and a motor boat trip up the Shrewsbury River.

MISCELLANEOUS NEW JERSEY NOTES.

The Braender Rubber & Tire Co., Rutherford, New Jersey, has completed its new factory and is running at full production.

A. R. de Santos, of the Braender Rubber & Tire Co., has returned from a nine months' trip through Spain, Italy, Switzerland, Germany, France, Holland, Denmark, Norway and Sweden.

The Compound Belting Co., Nutley, New Jersey, has changed its name to the Maywald Rubber Co.

Dr. W. F. Zimmerli is now the chemist of the Howe Rubber Co., New Brunswick, New Jersey, devoting all his time to this organization.

The Michelin Tire Co., of Milltown, New Jersey, has protested to the town authorities about the proposed tax on jitneys carrying employees from their homes to the plant. The company carries nearly 1,000 persons daily in the jitneys and protests against paying a fee for each bus.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.
BOSTON NOTES.

RUBBER COMPANIES were well represented at the National Shoe and Leather Exposition and Style Show held in Boston recently. The United States Rubber Co. showed Ukside soles and top lifts, also Spring Step heels. The booth was in charge H. A. Derry, and Miss Betty Marquis, a model, wore shoes of leading manufacturers on the style runway with Ukside and Spring Step products.

The Hood Rubber Co. booth was in charge of Mr. Shepard, and "The Red Man" and woman, models which were replicas of the well-known Hood sign boards, displayed a variety of rubber and fabric footwear, including a man's walking shoe of brown canvas; a military-heel house-shoe; a molded-sole basketball shoe; a one-strap shoe; a cross-strap shoe in brown; a white Flexipac shoe for coal miners; a pressure-cured black rubber boot with fabric lining made to withstand the action of acids and oils; and the Society gaiter with five eyelets, ribbon laced, of Jersey cloth in black with high heel.

The Goodyear Tire & Rubber Co. showed Neolin soles and Wingfoot heels, while the Wids Co. and the Foster Rubber Co., with William P. Noll in charge of the Cat's-Paw heel exhibit, were well represented.

The Converse Rubber Shoe Co. featured its Big Nine shoe for hard, everyday use, athletic sports and camping.

The Portage Tire Co. has moved to larger and better quarters at 805 Beacon street, Boston, the former Boylston street branch having proved inadequate to handle the increasing business in Skidlock tires. C. E. Aldridge is New England manager.

The B. F. Goodrich Rubber Co. recently removed its offices to

larger and more spacious quarters in the firm's handsome fire-proof building at 867 Boylston street. The Boston tire division is located on the first floor, with the administration offices on the second. The office of the district manager, F. T. Moore, is on the sixth floor, and surrounding him there, and on the fifth are the offices of the district sales executives. The fourth and third floors are occupied by the credit, bookkeeping and general operating departments.

The Davidson Rubber Co., Boston, in line with its policy of manufacturing only a few specialties of high grade, is featuring its line of rubber gloves, for the manufacture of which it maintains a complete dipped goods plant with modern equipment for making high-class goods.

F. H. Appleton & Son, Inc., Boston, has changed the name of the organization to Appleton Rubber Co. F. H. Appleton is president.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has appointed W. P. McGlynn its Boston representative, succeeding R. I. Winterringer, transferred to Cleveland.

The United States Rubber Co., New York City, has promoted J. P. Haney, formerly branch manager at Boston, to the position of district manager, and H. E. Crocker, formerly branch manager at Providence, to succeed Mr. Haney as Boston branch manager.

MISCELLANEOUS MASSACHUSETTS NOTES.

A two-day institute on industrial Americanization, conducted under the joint auspices of the Harvard Summer School and the Associated Industries of Massachusetts was held in Cambridge late in July. Members having, or contemplating, classes in English for alien employees, sent representatives and much of value in solving this great problem was developed by talks and discussions. Among the speakers were J. F. Tinsley, general manager, Crompton & Knowles Loom Works, Worcester, who spoke on "Methods and Achievements"; E. A. Fiesinger, educational director, Solvay Process Co., Syracuse, New York, who talked on industrial Americanization in the Empire State, and Miss Rose O'Toole, director of factory classes, United States Rubber Co., whose subject was "Factory Classes in Boston."

Owing to the impossibility of securing enough stitchers in Malden, the Converse Rubber Shoe Co. has established a stitching room at Concord, where 40 to 50 young women are now turning out better than 1,100 pairs of leather-trimmed tennis tops a day. The tops leave the Malden factory all cemented and go back from Concord completely stitched and eyeleted, ready to be laced on. A regular truck service is maintained between the two places.

Among the Massachusetts industrial concerns which give their employes a week's vacation with pay are the Boston Rubber Shoe Co. and the Converse Rubber Shoe Co., both of Malden.

To relieve the New England coal situation manufacturers are being encouraged to use anthracite coal screenings mixed with bituminous coal. The Boston Woven Hose & Rubber Co., Cambridge, has gone one better and is burning 200 tons per week of wharf screenings mixed with bituminous coal. By utilizing this fuel the company has been able to haul the tonnage in trucks without resorting to open-top railroad cars.

The Monatiquot Rubber Works Co., reclaimer and manufacturer of "naturalized" rubber, South Braintree, has completed a second siding on the east side of its extensive property, which will open it up for development. In addition, the company has storage space for one or two years' supply of coal. This is an insurance against a repetition of last winter's state of affairs when New England manufacturers were confronted with the danger of having to close down their plants because of lack of coal. The company now has all its executive and clerical offices installed in the new office building at South Braintree.

E. S. Kochersperger, of the Hood Rubber Co., Watertown, has been nominated a member of the executive committee of the

Safe Roads Federation of Massachusetts by the Associated Industries of Massachusetts. The object of the Federation is to reduce highway accidents through education and arousing of public sentiment.

The new canvas shoe prices of the Hood Rubber Co., Watertown, effective August 2, show a general advance of 25 to 30 per cent over last year's prices.

The baseball team of the Apsley Rubber Co. Athletic Association, composed of factory workers of the Apsley Rubber Co., Hudson, Massachusetts, holds the record of winning 12 out of 13 games played this season, including those with teams from the American Rubber Co. and the Boston Woven Hose & Rub-

APSELY RUBBER CO. BASEBALL TEAM.

ber Co., both of Cambridge, Massachusetts. The Apsley team has scored 118 runs to opponents' 32, and 159 hits to opponents' 73, while its batting average is .327 to opponents' .170. Norman has pitched nine games, winning eight, with a record of 104 strike-outs. Plouffe has pitched four games, winning all, with a record of 31 strike-outs.

The season's entire output of men's one-buckle and four-buckle cashmerette gaiters at the Converse Rubber Shoe Co., Malden, is being made by the new machine-making process described recently in *THE INDIA RUBBER WORLD*. Constant experimenting with the machines and patterns has brought these shoes to the point where they are not only a commercial success, but they show wearing qualities superior to the hand-made article. The bulk of the output at the present time is the four-buckle shoe.

The Tyer Rubber Co., Andover, Massachusetts, has made a number of changes in its office in No. 1 factory. More floor space has been added and better lighting arrangements installed. A conference room for committee sessions has also been added. The factory was closed from July 31 to August 9 for the annual vacation of the employees. An active campaign of education in safety will be conducted among employees during the next few months, the safety committee having been considerably increased and the work reorganized.

The President Suspender Co., Shirley, Massachusetts, has purchased a two-story factory and ten acres of land in Clinton, in the same state, and will equip the factory with looms for weaving elastic web, together with the necessary spoolers and warpers. It is hoped to begin production in September. This is the second shop acquired by the company in Clinton, a stitching room for finishing suspenders and garters having been established there a year ago. The officers of the company are: C. Fred Edgarton, president; David C. Lash, vice-president and general manager; and F. H. S. Hyde, vice-president. The company is also selling agent for the Knickerbocker Suspender Co.

Humphrey O'Sullivan of Lowell, Massachusetts, inventor of the O'Sullivan rubber heel, has been made a knight of St. Gregory the Great by the Pope. This honor recognizes the charitable work done by Mr. O'Sullivan for the Catholic churches of Lowell, and his many good deeds and acts of generosity.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

AUGUST saw the vacation period and the annual outing festivities attain their zenith for the year, it being a month marked by unusual social activities. Factory outings were one of the features and the reports from every one proclaimed the satisfaction and enjoyment which resulted from these respites from work.

The second annual outing of the overseers of the Hope Webbing Co., Pawtucket, was held July 24 at the Hummocks, in Hamilton. The party left the company's plant in automobiles at 9 o'clock, arriving at noon, when a luncheon was served, at which there were about 75 persons present. In the afternoon a baseball game was played, followed by a sports program, which included several races and exhibition diving. At the conclusion the gathering enjoyed an old-fashioned clambake.

A full-course Rhode Island clambake, athletic events, and a dance were features of the third annual outing of the Mutual Benefit Association of the Davol Rubber Co., at Emery Park, and attended by 250 members and friends. After lunch a baseball game was played, followed by the clambake in the afternoon and dancing. Prizes were awarded to the first and second place winners of the various events.

Another outing of importance was the third annual field day of the employees of the Tubular Woven Fabric Co., held at the grounds of the Warwick Club, July 31. A light lunch was served, followed by a course dinner in the afternoon and a baseball game and a program of sports. Music was furnished by an orchestra and dancing was enjoyed until 5 o'clock, when the party left the resort for Rocky Point and at 9 o'clock the return trip was made.

The fifth annual outing of the Revere Rubber Co., to Lake Pearl on July 31, was enjoyed by more than 1,500 employees. A variety of amusements was offered; competition in athletic events, prize dancing and riding in launches and on the merry-go-rounds. In the dancing contests Robert Clark and Miss Egan won the first prize in the waltz. The married men asserted their superiority over the bachelors in a baseball struggle and the solid tire department took the measure of the engineers' department in the tug-of-war.

The outing of the employees of the Atlantic Tubing Co., at Doby's Grove on August 7 was a success. The dinner was a big feature but there were many games that were decidedly interesting. The baseball game between the married and single men was won by the "free-for-alls." There was a tug-of-war and Harry L. Lippitt, who was playing host for the occasion, was captain of the winning side.

More than 3,500 employees of the Alice and Millville rubber mills of the Woonsocket Rubber Co. at Woonsocket and Millville, and of the Lawrence Felting Co., were the guests of the Woonsocket Rubber Co. mill management, at an outing on the company's recreation grounds off Fairmount street, Woonsocket, on August 7. The festivities began at 1 o'clock and ended at 6:30 o'clock. Early in the afternoon the Millville team defeated the Alice nine in a baseball game. Dancing was enjoyed on a dance floor erected in the grove, while a large number of booths of various kinds provided amusement and at some of them refreshments were distributed free.

The National India Rubber Co. has begun the operation of a plan by which visitors may be shown through the entire factory by Miss Dorothy Hillard, who has been appointed factory

guide. Factory employees are also allowed to take advantage of the services of the guide during working hours by making an appointment through the industrial relations bureau. During the past month many of the employees have taken full advantage of the privilege.

The new branch of the National India Rubber Co., of Bristol, that has been established in the old Perry Mill building on Thames street, Newport, began operations on Monday, July 26, about 75 employees taking up the work at the start. The branch will, for the present, make the tops for the shoes. Later a department will probably be established for the making of the shoes. A number of young women from the Bristol plant went to Newport to assist in getting the new plant under way and to give instructions.

Some months ago the I. T. S. Rubber Co., of Elyria, Ohio, brought an infringement suit before Judge Arthur L. Brown in the United States District Court for Rhode Island, against the United States Lace & Braid Manufacturing Co., of Auburn, R. I., declaring that a rubber heel as manufactured by the Rhode Island concern infringed on the patent rights of the plaintiff. Judge Brown issued an order stopping the defendant from the further manufacture of the heel in question. Since then the defendant has made certain modifications in the heels, and on July 27 asked permission of the court to manufacture them. The defendant was told by Judge Brown, in an opinion handed down from the bench, that he would not consider the new heel an infringement.

The Mount Hope Spinning Co. closed its mills at Warren, Rhode Island, at noon July 31 for a period of two weeks, not for lack of orders, however. By reason of the increasing business a new mill was erected last spring, but unforeseen obstacles prevented the machinery installation. During the shut-down the entire plan of the mill was changed as to the location of the machinery and much of that located in the old mill was transferred to the new one, and the new machinery brought overland by auto trucks from Taunton and Lowell, was set up in the old structure. When running in full the capacity of the concern will be more than doubled. The Mount Hope Spinning Co. manufactures yarn for automobile tire fabric, and has large orders on hand that ensure several months' steady business.

The Kielstone Rubber Co., a Massachusetts corporation, has leased the factories of the Lynn Rubber Manufacturing Co., Warren, Rhode Island, and has started operations. The sales department has been established at 11 High street, Boston, in charge of M. S. Klein, sales manager. The company is planning to increase the output of the rubber specialties made by the Lynn Rubber Manufacturing Co. several times, and, in addition, will make a high grade rubber heel. The new company expects to employ more help within the next 30 days, as soon as additional machinery and equipment can be installed. The officers and directors of the company are as follows: president, Eliston H. Bell; vice-president and sales manager, Myer S. Klein; treasurer, J. Everett Stone; secretary and clerk, Robert J. Holmes; directors, L. P. Bosworth, and E. K. Watson, Warren; R. J. Holmes, M. S. Klein, George Marsh, and E. H. Bell, Boston. Mr. Stone, treasurer of the company, will be in Warren and will have full charge of the manufacturing and business of the concern. J. W. Long, former president of the Lynn Rubber Manufacturing Co., is still with the new concern and will continue as superintendent in charge of the manufacturing. W. L. Castillo, former assistant purchasing agent of the Plymouth Rubber Co., is the purchasing agent of the Kielstone Rubber Co. and L. E. Libby has assumed the position of production engineer.

Work is to be started in a short time on a large addition to the plant of the American Wringer Co., Woonsocket. The extension will be on Pond street and is to be 182 by 66 feet with a projection in the rear, 28 by 30 feet. There will be one high story and one normal one, the height to be 45 feet. It will have steel

frame, steel sash and brick walls and the work will cost approximately \$100,000. A freight elevator will also be installed.

E. T. Richardson, formerly branch manager of the United States Rubber Co. at Portland, Maine, has been promoted to the position of branch manager at Providence.

Walter Smith, of New York, formerly commercial agent for the New York Central Railroad, has been appointed traffic manager for the National India Rubber Co., at Bristol. James Cruickshanks, who has been holding the position temporarily, has been appointed assistant superintendent of central stores.

PAUL W. LITCHFIELD, FACTORY MANAGER.

PAUL WEEKS LITCHFIELD, vice-president and factory manager of The Goodyear Tire & Rubber Co., Akron, Ohio, has recently completed twenty years of service with the company and is as proud of the gold service pin presented to him as any veteran workman who has been similarly honored.

Mr. Litchfield is of New England extraction, having been born in Boston in 1875, educated in the public schools and English High School of that city and graduated from the Massachusetts Institute of Technology in 1896 with a B.Sc. degree in chemical engineering. He was first employed as a surveyor for the Massachusetts Metropolitan Park Commission. After six months he entered the employ of L. C. Chase & Co., Boston, manufacturer of tire and carriage cloth, which was his introduction to the rubber industry.

His next step came with a transfer to the New York Belting & Packing Co., Passaic, New Jersey, as foreman of the molded goods and packing departments. From there he went to the superintendent's chair of the International Automobile & Vehicle Tire Co., which later became the Michelin Tire Co., of Milltown, New Jersey.

In 1900 he became associated with The Goodyear Tire & Rubber Co. as factory manager, a position in which he has developed remarkable capacity under an ever-increasing burden of responsibility that now also includes the offices of vice-president and director, and president of The Goodyear Cotton Mills, Inc., Killingly, Connecticut.

Mr. Litchfield has been a keen student of the human element in factory management and his influence has made the Goodyear company a leader in the modern idea of industrial relations and welfare work. In 1915, at a banquet tendered him by the company on the occasion of his fifteenth anniversary with the organization, he presented a gift of \$100,000 to be established as a welfare fund for the benefit of factory employees. He is a firm believer in the participation of labor in the management and ownership of large industrial plants, and the large number of Goodyear employee stockholders and the elective legislative body made up of employees and known as the Council of Industrial Relations to regulate shop affairs are but practical applications of

PAUL W. LITCHFIELD.

his theories. The outcome of this daring but apparently successful innovation is being watched with much interest by the entire industrial world. Goodyear Industrial University was also a child of his brain. It is not surprising, therefore, that he is as well liked and respected by those working under him as by his business associates.

Mr. Litchfield is a member of The Rubber Association of America, of which he was a director in 1917; a member of the Society of Automotive Engineers, before whom in 1915 he read a scientific and practical paper on "The Size and Inflation of Pneumatic Tires" that is still the standard treatise on that subject; and a member of the Rotary Club, Akron City Club, and Akron University Club, and a Knight Templar.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

F A. SEIBERLING, president of The Goodyear Tire & Rubber Co., and C. B. Raymond, vice-president of The B. F. Goodrich Co., recently reviewed the outlook for Akron, the rubber center of the world, for the official publication of the Akron Chamber of Commerce, and pointed out that the present lull in the trade is transitory and that the future appears brighter than ever before. The industry is based upon solid foundations and the fact that the number of automobiles in the United States and the world will be doubled within a few years makes these predictions safe.

C. B. Raymond said:

"We are facing facts. Akron business men foresaw months ago that these conditions were coming. They are prepared, and being prepared, will be able to weather the storm.

"Legislation for the special benefit of some, regardless of results to others; extravagance of the Government; crying demands for decreases in prices; reckless legislation looking towards the decrease in prices have brought their natural results. People stopped buying. Manufacturers were compelled to curtail.

"Akron will suffer less than many other cities. People may not be buying automobiles. But their old cars are running and are using up tires.

"The pendulum is bound to swing back. It was inevitable the present conditions should come. It is inevitable better conditions will return."

F. A. Seiberling said, in part:

"The business situation in this country is acute at this time, while adjusting to the shock of restricted credits applied by the Federal Reserve Banks and the effects of the railroad strike. Within a few months this extreme pressure will be removed, but the orderly process of deflation of war values will move quietly and steadily on the equilibrium.

"So far as Akron is concerned, we have reached bottom in the production of tires. Abnormal stocks over the country are being steadily absorbed and the curve of production within a few months will be steadily upward.

"Eight million cars are now running in this country; within five years this number will approximate fifteen million cars—all with tires, the major part of which must be furnished by Akron. The rubber industry is on a solid foundation, unsurpassed by any other industry in this country.

"This is the time for sensible optimism. Everyone who is conscientiously desirous of doing his duty to himself, to Akron, to his country, will, in a time like this, stand by the guns, keep faith, do more work, and keep cool."

George D. Bates, vice-president of the First-Second National Bank, said:

"It is the Federal Reserve banking system backed by the great banking institutions which is responsible for heading the nation from a wild orgy of spending back to the safe and sane path which will ultimately lead to the greenest pastures in which this country has ever found itself.

"Business was rushing wildly on. The end could only be a terrible precipice. Quietly the word went out credits must be curtailed. Inflation must stop. Expansion not absolutely necessary ceased, and over night the great country was headed from certain ruin back to the road leading to prosperity."

AKRON NOTES.

Although a general scarcity of coal has been evident throughout Ohio because of an Interstate Commerce Commission order compelling the sending of large amounts of coal to the Northwest via the Great Lakes, Akron has a good supply on hand and when that is exhausted the mines owned by the Akron companies will be able to supply the deficiency. Since the strike of last year the companies purchased and have operated mines in the coal fields.

The building of aircraft will not be deterred in Akron because of a fire of unknown origin which burned three machines in their hangar at the Wingfoot aviation station owned and operated by The Goodyear Tire & Rubber Co. The hangar has been repaired and new machines are being assembled to take the place of those destroyed. One of the machines, the D-1, recently described in THE INDIA RUBBER WORLD, belonged to the government at the time it was burned. No one was injured in the fire and the losses were covered by insurance.

Theodore E. Smith, editor of the "India Rubber Review," Akron, has been appointed a member of the Honorary Advisory Council of the Fifth International Exhibition of Rubber, Other Tropical Products and Allied Industries, to be held in London, England, in June, 1921.

The Firestone Tire & Rubber Co., Akron, recently took an inventory, giving employees a week-end vacation of two days.

Mark L. Felber, formerly editor of "The Press," has been appointed editor of "The Firestone Non-Skid," Firestone Park, Akron.

C. H. Sorrick and J. F. Cast, manufacturers' sales manager and assistant manufacturers' sales manager, respectively, of the Firestone Tire & Rubber Co., Akron, have qualified for admission to associate membership in the Society of Automotive Engineers.

In a letter sent to the tire trade early last month, The B. F. Goodrich Co. guarantees present schedules until November 1, stating that in the event of any unforeseen condition arising which would enable a general reduction in present schedules prior to November 1, they will stand back of their guarantee by protecting Goodrich dealers on all stocks on hand unsold at the time of such reduction which were purchased between the present date and November 1.

Frank A. Seiberling, president of The Goodyear Tire & Rubber Co., Akron, has been elected president of the Lincoln Highway Association, succeeding Henry B. Joy, who is leaving the United States for a year. This is Mr. Seiberling's second election to the office.

The Miller Rubber Co., Akron, has sold its dipped goods department to The Seamless Rubber Co., New Haven, Connecticut, due to increased demand for automobile tires. The company will continue to make its remaining lines of druggists' sundries and all other present lines of products.

The Firestone Tire & Rubber Co.'s athletics have been in charge of Paul P. Sheeks as athletic director for a number of months. He was responsible for the first undefeated football team at Wabash College.

Arthur H. Leavitt, who last autumn resigned from the sales department of The B. F. Goodrich Co., Akron, to accept a position as assistant sales manager of The Akron Rubber Mold & Machine Co., has been appointed general sales manager for The Amazon Rubber Co., Akron, thus resuming connection with the tire business.

CLEVELAND NOTES.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has promoted C. E. Pumphrey to the position of general

sales manager, succeeding H. M. Bacon, resigned. Mr. Pumphrey was formerly assistant sales manager and has been with the company seven years.

W. H. Hurley, formerly manager of the New York branch of the McGraw company, has been made assistant sales manager in Cleveland.

R. I. Winterringer, formerly the McGraw company's Boston representative, has been appointed in charge of the Cleveland territory, succeeding G. E. Bovis, promoted.

H. G. Couturier has been made sales promotion manager of the McGraw company at Cleveland, having been transferred from Chicago. This position is in a newly created department.

The United States Rubber Co., New York City, has promoted W. T. Irwin, formerly branch manager at Youngstown, Ohio, to the position of branch manager at the Cleveland office. C. L. Wood, formerly salesman at the Cleveland branch, is promoted to be branch manager at Youngstown.

The McElrath Tire & Rubber Co., Cleveland, Ohio, has appointed E. S. Curtis sales manager and W. D. Richards, factory superintendent. The H. B. Bixler Co. has been retained as consulting engineers. The company's new factory, 100 by 300 feet, is well under way and will have 45,000 square feet of floor space. Machinery equipment sufficient to make 1,000 cord truck tires will be installed, as the company will specialize in machine-made tires of this kind. The equipment has already been purchased. The premises cover 1½ acres of land in Ravenna, one of the suburbs.

The Advertising Managers Council of the Motor and Accessory Manufacturers' Association, comprising the executives of the principal companies interested in automotive equipment, will hold a convention at Camp Nela, Nela Park, Cleveland, Ohio, on Friday and Saturday, September 17-18, 1920. Tents will be erected to accommodate the visitors and sports will be enjoyed. It is expected that the recent developments in the automotive industry will make this meeting both interesting and important. E. C. Tibbetts, advertising manager of The B. F. Goodrich Co., Akron, Ohio, is chairman of the executive committee which is working on the program for the meeting.

MISCELLANEOUS OHIO NOTES.

The Dayton Rubber Manufacturing Co., Dayton, Ohio, through the disposition of \$3,000,000 of preferred stock, is quadrupling its present plant capacity. The additions are being built in accordance with the original plan when the first unit was erected in 1917. The property covers 22 acres and the company has no bonds or mortgages of any kind on it. "Dayton Airless" and "Dayton Thorobred" cord and fabric tires are being manufactured. J. A. MacMillan is president.

The Lancaster Tire & Rubber Co., Columbus and Lancaster, Ohio, has appointed Richard Gibson, Jr., technical superintendent. He formerly held a similar position in the tire department of the Hewitt Rubber Co., Buffalo, New York, and has also been tire development engineer of the Republic Rubber Corporation, Youngstown, Ohio, and assistant chemist of the Racine Rubber Co., Racine, Wisconsin, and of the Kelly-Springfield Tire Co., Akron, Ohio.

The Akron Maderite Tire & Rubber Co., Newton Falls, Ohio, has changed its name to the Trumbull Tire & Rubber Co.

The Republic Rubber Co., Youngstown, Ohio, was closed down for six days in July, for the regular semi-annual inventory. The pneumatic tire department was shut down until August 16, when it resumed operations. All departments are now running.

The Mason Tire & Rubber Co., Kent, Ohio, has created a factory engineering department in charge of H. W. Sidnell. The entire staff of the department when fully organized will consist of from eight to ten men. E. B. Harvey is manager of the planning division, W. W. Peffers of the raw material department, and

W. S. Agnst will have charge of the tire design department. As a result of the transfer of Mr. Sidnell from the office, A. J. Lauderbaugh has been promoted to the position of assistant secretary and office manager.

An eastern sales district, comprising all branches east of Indianapolis, has been created by The Mason Tire & Rubber Co., Kent, Ohio, in charge of Earl W. McCreery, with headquarters at the factory in Kent. Mr. McCreery was formerly assistant sales manager of the Portage Rubber Co., Barberton, Ohio.

E. K. McMillen has been appointed foreman of the milling department, in charge of mills and calenders of The Mason Tire & Rubber Co., Kent, Ohio, succeeding H. L. Parsons. Mr. McMillen has been connected with the rubber business 17 years, and was formerly with the Firestone Tire & Rubber Co. and The B. F. Goodrich Co., Akron. He comes to the Mason company from the New Castle Rubber Co., New Castle, Pennsylvania.

E. H. Lybrook, for the last year in charge of the electrical construction work of the United States Nitrate Plant, Toledo, has been appointed chief electrician of The Mason Tire & Rubber Co., Kent, Ohio, succeeding the late George J. Murray. Mr. Lybrook has had ten years' experience in electrical work, and is a graduate of Purdue University.

The Allied Belting Co., Greenville, Ohio, has increased its stock from \$60,000 to \$100,000, and will move its factory from Toledo to Greenville, where it is now building a factory to cost approximately \$25,000. George C. Baker is vice-president, and W. R. Graham is factory manager.

THE MID-WEST RUBBER ASSOCIATION'S GENERAL MANAGER.

HARRY STEPHEN VORHIS, who until July 1 of last year was secretary and treasurer of The Rubber Association of America, when he resigned and joined the Gutta Percha & Rubber Manufacturing Co., of New York, and later was made general manager and secretary of the Mid-West Rubber Manufacturers' Association, is well known to nearly everybody in the rubber trade through his former close connection with the industry.

Mr. Vorhis brings to the Mid-West Rubber Manufacturers' Association a broad experience that peculiarly fits him for the work. Under his able management this young association may be expected to redouble its already sturdy stride, for it is growing rapidly. Since Mr. Vorhis assumed his duties in February, fifty new members have been added, making a total of 132, and a "live wire" bulletin service has been inaugurated. Attendance at monthly meetings has increased from about thirty to sixty members and a spirit of friendly cooperation and enthusiasm is being manifested. Both Mr. Vorhis and the Association are to be congratulated.

HARRY S. VORHIS

THE RUBBER TRADE IN THE MID-WEST.

MID-WEST RUBBER MANUFACTURERS' ASSOCIATION OUTING.

THE FIRST ANNUAL OUTING of the Mid-West Rubber Manufacturers' Association, held at the Hotel Breakers, Cedar Point, near Sandusky, Ohio, August 16-17, was an unqualified success as to attendance and enjoyment. Many rubber men from Ohio accepted the hearty welcome of the Westerners and were amply repaid in the coin of good-fellowship that freely circulates among the rubber men.

An enjoyable dinner was held in the hotel pavilion on Monday evening and on Tuesday morning there were beach sports. The swimming race was won by O. A. Ragsdale of the Hunter Dry Kiln Co., the prize being a golf bag. The fat man's race was won by E. S. Babcox of the Akron Advertising Agency Co., the prize being a silver pen and pencil. The wheelbarrow race was won by K. Hassenzahl, Akron representative of Gove & French and Mr. Rodenbough, Akron representative of F. R. Henderson & Co., the prize being a pin-seal bill-fold to each winner. The fifty-yard dash was won by Henry O'Reardon, advertising manager "Tires," New York City, the prize being a silk umbrella.

Luncheon was held immediately after the sports, after which there was held a brief business session, presided over by Theodore E. Smith of "The India Rubber Review," Akron, Ohio, who addressed the meeting on present conditions in the trade. Jesse E. LaDow, secretary of the Mansfield Tire & Rubber Co., Mansfield, Ohio, gave an interesting account of his travels through the countries of crude rubber production in the Far East. E. S. Babcox, of Akron, said that, while present dull conditions in the tire trade had seemed inevitable, he believed that better business was in store for the trade this coming winter. Interesting remarks were also made by J. E. Allen of the Braender Rubber & Tire Co., Rutherford, New Jersey, Henry O'Reardon of "Tires," Mr. Ragsdale of the Hunter Dry Kiln Co. and by W. F. Harrah of the National-Standard Co., Niles, Michigan.

The following new regular members were elected: Sterling Tire Corporation, East Rutherford, New Jersey, and Hubbell Tire & Rubber Co., 6545 Carnegie avenue, Cleveland, Ohio; new associate members—Cabarrus Cotton Mills, Kannapolis, North Carolina; Edward Lyman Bill, Inc., publisher of "Tires," 373 Fourth avenue, New York City; Akron Industrial Salvage Co., Akron, Ohio; Hunter Dry Kiln Co., Indianapolis, Indiana; Keystone Lubricating Co., Philadelphia and Pittsburgh, Pennsylvania, and National Aniline & Chemical Co., Inc., Akron, Ohio.

A vote of thanks was then passed to the outing committee, consisting of the following: H. S. Vorhis, chairman, who is general manager of the Association; E. T. Meyer of F. R. Henderson & Co., Chicago, Illinois; Paul A. Bloom of Fred Stern & Co., Chicago, Illinois; C. H. Taveniere of Charles E. Wood, Chicago, Illinois; and J. Matthias, Jr., of Mineral Point Zinc Co., Chicago, Illinois.

MISCELLANEOUS MID-WESTERN NOTES.

The A. Plamondon Manufacturing Co., 24 North Clinton street, Chicago, Illinois, is constructing a two-story building at 5301 South Western avenue for pattern storage, as an addition to its new plant into which it expects to move about October 1. J. T. Benedict is treasurer of the company. Shafting, pulleys, clutches, and machine-molded gearing are manufactured.

The officers of the International India Rubber Corporation, South Bend, Indiana, are: George W. Odell, president, treasurer, and general manager; Peter E. Studebaker, vice-president. John C. Witmer is factory manager. The plant is located on the Pennsylvania-Vandalia railroad within the city limits, and the factory buildings are of brick and steel construction. The plant is working night and day producing Odell cord and South Bend fabric tires. A description of the Odell cord tire appeared in our June issue.

The Wawasee Tire & Rubber Co., Syracuse, Indiana, is completing plans for an H-shaped three-story building, each side of the H being 50 by 175 feet and the cross-piece 50 by 60 feet. The power-house, to be separate, will have four 300-horse-power boilers, generators, pumps, a Fairchild coal unloader, automatic sprinkling tank, and two large benzine storage tanks. It is expected that work on the factory will begin soon, and that it will be completed by next spring. The company will specialize in tires and tubes, high-voltage electricians' and acid gloves, etc.

F. R. Granger, formerly head of the service department of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, has been appointed general sales manager of the Fort Wayne Tire & Rubber Manufacturing Co., Fort Wayne, Indiana. The company is now placing on the market the "Wayne Rough Shod" and ribbed tread tires in fabric construction and expects to be in full production of cord tires also by the first of next year. The concern also makes "Wayne Supertested" red and gray inner tubes.

The Altenburg Tire Equipment Co., Davenport, Iowa, has voted to increase its capital stock from \$25,000 to \$50,000, to take care of increased business. A new factory site on the Rock Island railroad has been purchased in West Davenport, consisting of 6½ acres, and the foundries and machine shops of the new plant are under construction and expected to be ready for occupancy by September 1. The company manufactures a complete line of tire-building stands, machines, and molds used in the manufacture of tires.

The Columbia Rubber Mills, 176 16th street, Milwaukee, Wisconsin, has bought the plant of the Joerns Manufacturing Co. at Sheboygan, Wisconsin, and will remodel it to be approximately 60 by 140 feet, two stories high, of reinforced concrete. There will be several smaller buildings, also. The equipment will include a general line of rubber machinery, such as calenders, presses, washing machines, tube mills, vulcanizers, mills, etc. Leo Hofmeister is president of the company as well as of the Tomah Rubber Works at the same address.

The Prudential Tire & Rubber Co., Erie, Pennsylvania, has taken over the plant and equipment of the Boone Tire & Rubber Co. at Chippewa Falls, Wisconsin, and is reported to have filed articles of incorporation in that state, with George N. Graham designated as agent.

The Detroit Insulated Wire Co., 641 Wesson avenue, Detroit, Michigan, has contracted for a three-story office building of reinforced concrete.

A western sales district has been created by The Mason Tire & Rubber Co., Kent, Ohio, in charge of H. C. Smith, formerly manager of the Kansas City branch, with headquarters at Kansas City, Missouri. This district will include all branches west of the Mississippi river and the Chicago, Milwaukee, and Indianapolis branches east of the Mississippi. W. S. Deamud succeeds Mr. Smith as manager of the Kansas City branch. He has been with the Mason company as a salesman for three years, traveling out of Chicago.

C. H. Connelly has been appointed southwestern manager of The Rubber Products Co., Barborton, Ohio, with headquarters at 2615 Walnut street, Kansas City, Missouri, where George B. Krestinger has also been appointed office manager.

The Terrell Tire & Rubber Co., 1512 McGee street, Kansas City, Missouri, which was incorporated under the laws of Delaware in April to manufacture the Fabri-Cord tire, inner tubes, etc., expects to start production at an early date. The officers are: A. C. Terrell, president and general manager; Otto W. Croy, vice-president; R. L. Meierhoffer, secretary and treasurer; directors—H. F. Zahner and George E. Duden, in addition to the officers.

W. H. Salisbury & Co., Inc., Chicago, Illinois, has just equipped a rubber mill at 411-421 North Morgan street, for the production

of molded and cut rubber goods, tubing, etc. The mill has been in operation about three weeks. The leather belting department of this company will also be under the same roof, thus placing the whole business under centralized supervision.

The Schmelzer Arms Co., Kansas City, Missouri, manufacturer of sporting goods, has moved into its new wholesale building at 2015-2019 Grand avenue, the retail location remaining changed. The company has also changed its name to "The Schmelzer Company," but the organization and personnel will continue as before.

Morton L. Paterson, one of the directors of the Converse Rubber Shoe Co., Malden, Massachusetts, and manager of the company's Chicago sales branch, returned on August 24 from a six weeks' vacation in Scotland.

The Steam Bag Corporation, 1545 Broadway, Denver, Colorado, has been incorporated in that state, with a factory at 1222 Elati street, Denver, to manufacture the "20th Century Steam Curing Bag" for vulcanizing tires. The company holds patents on the device covering the United States, Canada, Great Britain, France, and Germany.

R. L. DeVoe has been appointed Chicago branch manager of the Madison Tire & Rubber Co., New York City, with headquarters at 1606 South Michigan avenue.

The Hunter Dry Kiln Co., Indianapolis, Indiana, has just completed a plant addition of brick and steel construction, approximately 105 by 85 feet, especially designed for the manufacture of its latest improved dryer. This device is made entirely of metal with the exception of its insulation, and because of its simplicity of construction and operation is in demand for export as well as for domestic trade. The company is also adding to its facilities for manufacturing the metal racks and trays which are used with this dryer.

The Strongcord Tire & Rubber Manufacturing Co., Evansville, Indiana, has increased its capital stock from \$250,000 to \$1,250,000. R. G. Schultheis is secretary, and the offices and sales rooms are at 413-414 Mercantile Bank Building.

The Federal Rubber Co. of Illinois, Cudahy, Wisconsin, which had planned a \$1,000,000 factory addition, to be six stories and basement, has postponed building until next year, on account of present conditions and the difficulty in getting delivery of steel before winter. It is expected that building operations will begin in the early spring, contingent on conditions at that time.

The plant of the Kansas City Tire & Rubber Corporation, Kansas City, Kansas, placed in the hands of receivers on May 24, 1919, has been leased to the A. J. Stephens Rubber Co. of the same city, which has also purchased all the liquid assets of the company. The plant is being operated on full time, manufacturing tires and inner tubes, and the Stephens company plans soon to add two night shifts in order to run 24 hours daily. The company also manufactures accessories and fabric products, some of which have been described in recent issues of THE INDIA RUBBER WORLD.

G. E. Bovis has been transferred to Chicago to represent The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, succeeding H. G. Couturier, transferred.

Resolutions against the compulsory adoption of the metric system were passed by the Society of Automotive Engineers at the recent business session held at Ottawa Beach, Michigan.

The Century Rubber Works, Chicago, Illinois, which some time ago effected the sale of its plant to the Zeglen Tire & Rubber Co., Inc., 118 North La Salle street, in the same city, for the purpose of manufacturing tires, has built a larger plant for its own use, into which it expects to move at an early date.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent.

ALTHOUGH STILL HANDICAPPED with a shortage of skilled labor and slow deliveries of needed machinery and supplies from the East and Mid-West, the rubber manufacturers on the Pacific Coast are making good progress in overtaking unfilled orders. All report general business conditions good and are cheerful about the outlook for the remainder of 1920. Efforts are being made continually to facilitate direct shipments of plantation rubber, and there is some talk of forming a manufacturers' purchasing agency to take over the business hitherto done largely by import brokers. Something may develop along this line in the near future.

Rubber mills which have been supplying tread stock to tire repair men on the coast were much relieved by the easing up of the gasoline shortage. During the two months of "gas" scarcity the bottom fairly fell out of the tread stock trade, as automobile owners, being unable to use their machines, deferred repair work until they could get more use of their cars.

The Western Rubber & Supply Co., 1011 South Olive street, Los Angeles, has been appointed southern California and Arizona distributor of Gillette chilled-rubber tires and tubes.

Many southwestern dealers in solid rubber tires intend to have exhibits at the tractor show (said to be the only one to be held in the United States this year) September 20-26 at Glendale, a suburb of Los Angeles.

In accordance with its new country-wide policy, the Miller Rubber Co., Akron, Ohio, through its subsidiary, the Miller Rubber Co. of California, has taken over the direct distribution of Miller tires throughout southern California. J. O. Ward is branch manager.

Distribution of the products of the Columbia Tire & Rubber Co., Columbianna, Ohio, will be made in California and Arizona by the Lichtenberger-Ferguson Co., of Los Angeles, and San Francisco, a leather firm which took up rubber goods a few years ago.

LOS ANGELES NOTES.

The Garlock Packing Co., Palmyra, New York, has opened a branch office in the Higgins Building, N. Main and Second street, Los Angeles, in charge of Frederick A. Griffith, son of the vice-president of the Garlock Co. An extensive stock of rubber and asbestos specialties will be carried at the new southwestern distributing station.

The Auto Tire Manufacturers and Jobbers Association has been recently formed by tire men for the purpose of correcting the abuses prevalent in the tire trade of Los Angeles. Frank T. Price is president and Alfred E. Adams, secretary. The other officers and directors are: J. R. Campbell, Roy R. Meads, Frank Osler, W. A. Rix, Adolf Schleicher, A. J. Straney, L. S. Utter, and J. B. Wood. The offices are at 903-904 Broadway Central Building, 424 South Broadway, Los Angeles.

A. Roy Knabenshue, of Los Angeles, California, has obtained the exclusive agency for Lehigh tires and tubes in southern California.

A native of Ohio, where he was born in 1876, Mr. Knabenshue has had a varied business career in the East, West and Middle West as a telephone engineer, designer of automobile accessories, balloonist, pilot and builder of dirigibles and manufacturer of inner tubes. In 1910 he obtained an order from the Air Service for a special spherical balloon and twenty-five observation balloons. He then organized the Knabenshue Manufacturing Co. and leased a factory at Northport, Long Island, where this government contract was completed. In 1919 he purchased the factory and equipped it for making Knabe inner tubes, which business he sold out in February in order to return to California.

Dr. Wayland A. Morrison has been chosen as consulting surgeon for The Goodyear Tire & Rubber Co., of California, Los Angeles, and will assist Dr. Louis D. Chaney, chief of the staff of the hospital which the company maintains in its factory.

The Holland-American steamship line will begin regular sailings this Fall via the Panama Canal between Los Angeles harbor and Boulogne, Rotterdam, and Plymouth. The trip from Los Angeles to the first port of call in Europe, Plymouth, will take thirty-five days. Ample accommodations, it is said, will be provided for freight and passengers.

J. Elden Shaw has been appointed Pacific Coast manager for the Standard Four Tire Co., Keokuk, Iowa, with headquarters at the Los Angeles branch, of which he will also have charge. Mr. Shaw was formerly sales manager of The Savage Tire Sales Co., San Diego, California.

Owing to the demand for Grow tires in the West and the railroad situation, the George Grow Tire Co. of Boston will erect another factory at Los Angeles, California. Four representatives of the firm are now on the Pacific Coast, prepared to negotiate for a site for the new plant.

SAN FRANCISCO NOTES.

C. E. Cook, head of the mechanical goods sales department of The B. F. Goodrich Co., Akron, Ohio, has been a guest of W. T. Powell, San Francisco district manager. Mr. Cook opened and conducted the San Francisco branch until he was called to a higher position in Akron.

The Eastern Manufacturers' Co., 312 Clay street, San Francisco, has been appointed Pacific Coast distributors of the Parco inner tires made by the Pan-American Rubber Co., Milwaukee, Wisconsin.

The Kern County Cotton Growers' Association, the first to be formed in central California, was organized August 8, at a meeting of cotton growers in Bakersfield, in which the office will be located. Picking prices at 2½ cents a pound for the short and 4½ cents for the long-staple cotton were decided upon. Kern county has 10,000 acres planted to cotton, this being the second season; and about 15,000 acres are planted to cotton in other San Joaquin Valley counties.

Jesse J. Hawkins has resigned his position as manager of the rubber footwear department of the San Francisco branch of the United States Rubber Co. to take charge of the rubber footwear department of the wholesale house of Cahn, Nickelsburg & Co., San Francisco. He was transferred to San Francisco two years ago to take charge of the C. R. Winslow branch of the United States Rubber Co., which was recently consolidated with the San Francisco branch.

SOUTHWESTERN NOTES.

Fully 15,000 acres of long-staple cotton, largely contracted for long in advance by makers of rubber tires, are under cultivation in Imperial Valley, California, and the crop prospects are excellent. The entire valley lies wholly below sea level and is irrigated by a canal from the Colorado river. The valley cities of Calexico, Brawley, and El Centro have experienced a remarkable boom, as evidenced by the census returns showing growths of 681, 512 and 239 per cent., respectively, in the past ten years. The prospects are for a greatly increased acreage in cotton next year, with prices well sustained.

Ground has been broken at Downey, California, by the West Coast Asbestos Co., a subsidiary of the E. M. Smith Co., Los Angeles, for a factory in which will be made a large variety of rubber-asbestos articles. On the tract of nine acres bought by the company a first mill unit will be erected, measuring 100 by 400 feet, half of which will be two stories high. This building, with machinery for crushing, spinning and weaving asbestos for brake linings, clutch facings, packing, etc., will mean an expenditure of \$250,000, it is stated. Heavy oil and fire

hose will be a specialty of the new concern, which will employ 150 men at the start.

A project for developing eighty sections in the Pecos Valley, Texas, for sulphur is being launched by a Los Angeles concern known as the Consolidated Sulphur Co., of which E. Barner, of Pecos, Texas, is the local representative. It is claimed that large deposits of sulphur, rivaling in extent those in Louisiana, exist in the Pecos Valley and that mining can be carried on at a small cost.

The Coahuila Rubber Co., a Detroit concern, has an experiment station, near San Jacinto in Southern California, devoted to raising guayule. The guayule plants are about half matured and, it is said, quite as satisfactorily as any similar growths below the Mexican border. The resident manager is J. G. Evans.

The United States Rubber Co., New York City, has promoted G. W. Manchester, formerly branch manager at Kansas City, to the position of district manager at Dallas, Texas, succeeding W. F. Gordon, resigned.

NORTHWESTERN NOTES.

James E. Haab, formerly factory representative of The Rubber Products Co., Barberton, Ohio, has been promoted, in charge of sales in the northwest district.

The Puritan Rubber Co., Inc., 16-17 Wilson Building, Yakima, Washington, has begun the construction of a \$500,000 tire and rubber factory to manufacture "Pathfinder" tires and tubes, and mechanical rubber goods. The officers are: F. C. Plouf, president and treasurer; L. W. Hobson, vice-president; and O. P. McElmeel, secretary.

The Occidental Rubber Co., Everett, Washington, has finally started its tire factory, after much delay due to slow deliveries of machinery; and it expects within a few weeks to be running well into quantity production.

The Western Diatomite Co., Lumber Exchange building, Portland, Oregon, of which J. W. Ganong is president, is having a warehouse built at its mines at Terrebonne to hold 20,000 sacks or 30 carloads of the white siliceous mineral powder which it sells in large quantities to manufacturers of insulation material. From another large mine at Harper, also in Oregon, a considerable and increasing amount of diatomaceous earth is supplied to many rubber mills.

THE TIRE IN-SOLE.

The "Mile Multiplier" is the name bestowed upon the new tire in-sole, a heavy, crescent-shaped, endless cushion of tough resilient rubber, with breaker strip on its outer surface, which is said to neutralize the conflicting forces that work destruction on a tire. It is made thick on the center and graduated down to a feather edge. No special preparation is required for its use—it is inserted between the casing and inner tube. It is covered by a guarantee against punctures, and prevents blow outs. It is claimed to outlast the life of several tires. (Tire In-Sole Manufacturing Co., Findlay, Ohio.)

THE "VULPA" TUBE AND PATCH.

"Vulpa" is the name given to the extra heavy red inner tubes manufactured by a New York firm, and likewise to its self-vulcanizing patch for inner tubes. This patch is applied to the repair in the usual way, and it is claimed that vulcanization takes place through the frictional heat of the running car. It is also claimed that the Vulpa patch will repair a cut of any size in a tube, and can likewise be used as emergency repair for blow-outs and cuts in casings, as well as for other rubber articles. (W. E. Spencer Co., 1 Park Place, New York City.)

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(820.) An exporter inquires for the name and address of the manufacturer of "Samson" rubber soles.

(821.) Request is made by a rubber company for the addresses of concerns who could utilize used tire casings in car-load lots.

(822.) A rubber manufacturer asks for the address of a company manufacturing a machine for sifting compounding ingredients.

(823.) Inquiry is made for the address of the manufacturer of a machine for inflating toy balloons.

(824.) A foreign correspondent asks for the name of the American manufacturer of derivatives of furfural, as furfuramide and furfuraniline used as accelerators, and also desires to know the American names of these chemicals.

(825.) A subscriber requests the address of the manufacturer of the Diamond wire wrapper for winding hose with wire.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following district or cooperative offices. Requests for each address should be on a separate sheet, and state number.

DISTRICT OFFICES.	COOPERATIVE OFFICES.
New York: 734 Customhouse.	Cleveland: Chamber of Commerce.
Boston: 1801 Customhouse.	Cincinnati: Chamber of Commerce.
Chicago: 504 Federal Building.	General Freight Agent, Southern
St. Louis: 403 Third National Bank	Railway, 96 Ingalls Building.
Building.	Los Angeles: Chamber of Commerce.
New Orleans: 1020 Hibernia Bank	Philadelphia: Chamber of Commerce.
Building.	Portland, Oregon: Chamber of Com-
San Francisco: 307 Customhouse.	merce.
Seattle: 848 Henry Building.	Dayton, Ohio: Dayton Chamber of
	Commerce.

(33,377.) A merchant in Norway desires to secure an agency for the sale of dress shields. Quote c. i. f. Norwegian port. Payment through banks.

(33,378.) A commercial agent in Canada desires to secure an agency for the sale of fountain pens. Quote f. o. b. American ports. Payments cash against documents.

(33,383.) A banking institution in Czechoslovakia desires to purchase 200 tons of asbestos for immediate shipment. Subsequent orders to amount to 400 tons annually. Quote c. i. f. European port. Payment cash in United States currency. Correspondence in Czechic, German or French.

(33,391.) A commission agent in Poland desires to secure an agency for the sale of rubber goods.

(33,411.) A commercial agent in Poland desires to secure an agency for the sale of balata belting, and rubber goods and packings. Correspondence may be in English.

(33,423.) A commercial agent in Cuba desires to represent manufacturers on a commission basis for the sale of tires.

(33,495.) Tenders are now being received by the chief of the fire department of a city in Canada for fire hose.

(33,506.) A firm in Argentina desires to secure an agency for the sale of rubbers used for motor cars. Correspondence may be in English.

(33,526.) A merchant firm in France desires to secure an agency from manufacturers for the sale of pneumatic tires. Correspondence should be in French.

(33,531.) A commercial agent in Austria desires to secure the representation of firms for the sale of American goods, including rubber manufactures, in that country.

(33,498.) A firm of merchants in Hungary desires to purchase rubber and asbestos goods.

(33,452.) An American exporter representing large European concerns, and who has connections in South America and other parts of the world, desires to secure representation for the sale of tires.

(33,550.) A firm of importers in India desires to be placed in communication with manufacturers and dealers in rubber-stamp-making machines and appliances.

(33,554.) An agency association in the Netherlands desires to get in touch with manufacturers who are not yet represented in that country, with a view to securing exclusive agencies for the sale of rubber hose for technical purposes.

(33,557.) A firm in Belgium desires to secure the general representation for the sale of tires for bicycles, motor cycles, automobiles and trucks; also automobile accessories.

MISCELLANEOUS FOREIGN NOTES.

TYPK & KING, LIMITED, Mitcham Common, Surrey, chemical manufacturers, is represented in Manchester by W. Harrison & Co., Limited, 14 Market Place, where J. G. Thurston, a director of the company, gives personal attention to inquiries from the rubber trade. The previous agency arrangement with Louis Minton, Trevelyan Buildings, Corporation street, Manchester, were terminated last April and the new agency connection became effective May 1 last.

The Society of Motor Manufacturers and Traders will hold its next motor exhibition towards the end of the year at the White City and Olympia. It is expected to be the largest display of motors ever held, not only in England, but on the Continent and in the United States as well.

A joint committee of British and American authorities has proposed to limit the weight of golf balls to 1.62 ounces, and the minimum diameter to 1.62 inches. The recommendations will come up for final consideration in September.

Milledge Brothers, Melbourne, Australia, will act as agents in Victoria for Mason tires. This territory includes the city of Melbourne and a number of important towns in southeastern Australia.

Muggli & Rieser, 93 Bahnhofstrasse, Zurich, Switzerland, have undertaken the sales of Mason tires and tubes in that country and expect to introduce them into Germany as soon as such imports are allowed by the German Government.

Rubber manufactures valued at \$211,653 were shipped to South Australia during 1917-18, compared with \$286,412 in 1916-17. There was also a decrease in asbestos packing, \$11,110 in 1916-17 as against \$8,973 in 1917-18. The export trade of South Australia suffered an even more serious decline from that of the previous year than did the import trade.

The Swedish importing concern, known as A. B. Orion Rubber Import Co., has voted to increase its capital from 150,000 to 300,000 kroner by issuing 1,500 shares at par.

The Askim Rubber Co. has been established at Askim, Norway, to manufacture rubber shoes and automobile tires. The capital stock amounts to 1,000,000 kroner, entirely paid in.

THE STRIKES AND LABOR TROUBLES IN THE RUBBER MILLS OF CLERMONT-FERRAND, France, have been settled. The plant of Etablissements Bergougnan is operating to full capacity and has been little affected by the recent labor troubles under which French industry has been suffering. The plant is somewhat behind on orders, as it has been since the signing of the armistice, and the Italian plant of the firm and the Bergougnan Rubber Corporation of Trenton, New Jersey, are helping to fill foreign orders.

ON THE LIST OF GOODS WHICH, ACCORDING TO LATEST INFORMATION, can be exported from Italy only under license, appear carnauba wax, ceresine, crude rubber and gutta percha, and reclaimed and waste rubber, including worn out rubber articles.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE PEACHEY VULCANIZATION PROCESS.

ON JULY 7, at the Grand Hotel, Manchester, Louis Minton gave a luncheon to a number of representatives of the rubber manufacturing and allied industries to meet S. J. Peachey, who it was announced would give a description of his new vulcanization process. The chairman proposing Mr. Peachey's health said he thought the gathering was unique in the annals of the British rubber trade and suggested that an organization somewhat on the lines of The Rubber Association of America would prove of interest and importance. He had no financial interest at all in the new process, but having had from the trade many inquiries concerning it he had conceived the idea of inviting Mr. Peachey to make any explanations he thought fit.

Mr. Peachey, in rising to respond, said that he did not propose to give an account of his process, as he presumed it was sufficiently well known by that time to the practical men he saw before him, and he would therefore merely adopt the rôle of answering criticisms, constructive or destructive as the case might be, on his process, which he wished to state emphatically is not a "stunt."

Prominent among those who took advantage of the opportunity to learn more about the process and its potential applications were J. K. Burbidge of Warne & Co., Limited, Tottenham; F. J. S. Gray, of St. Helen's Cable & Rubber Co., Limited; A. E. Salmon, of Chess & Stead, Limited; and Mr. Gibson, of Turner Bros. Asbestos Co., Limited.

The points raised related largely to the manufacture and application of the two gases and to the application of the process to molded goods, such as buffers. Rubber cable insulation, asbestos jointing and waterproof textures also came up for discussion. Naturally at this stage of affairs the patentee is not ready with cut and dried details of procedure with regard to the large and diverse number of goods which the rubber manufacturer produces and he did not hesitate to say so. In some cases which had special mention he said that experimental work was in progress and he was not at the moment prepared to say anything by way of elucidation. With regard to pneumatic tires the present position, Mr. Peachey said, is that the process is not applicable. It is clear that there will have to be special mechanical appliances for building up, this being a matter for development in the future. With regard to the production of buffers, a point on which considerable discussion took place, the patentee was persistently optimistic as to the results which might be expected by building up in layers to be jointed by the new solution process, quite a moderate cold pressure being all that would be required.

Asked as to the formation of sulphuric acid through the process, Mr. Peachey said that he had not noticed it, but a weak ammonia treatment would be effective against it. As to the action of sulphur dioxide in certain fillers, he had not made any experiments, but in his ordinary procedure the hydrogen sulphide was always in excess, which meant that no free sulphur dioxide could occur in vulcanized goods.

With regard to the gases, the sulphur dioxide would be purchased by rubber manufacturers, though the hydrogen sulphide would probably have to be made on the premises and he agreed with one of the speakers that a permit would probably have to be obtained from a Government department. He thought that the toxicity of this gas had been exaggerated; indeed, he ventured to say that in small quantities it was an appetite improver and a dietetic. Plans for the necessary plant are now being prepared by important rubber engineers who have expressed themselves as confident of overcoming any initial difficulties.

Questioned on the point of the water produced in the chemical reaction between the two gases, Mr. Peachey said he had not

found this to cause any trouble; it was produced in a very finely divided state and soon diffused out of the rubber, or could be removed by drying the rubber for an hour or so at, say, 35 degrees C. He had ideas of a mold made of some porous material for molded goods, but so far had nothing in that direction to report. With regard to compounded goods, Mr. Peachey said that pure rubber is more difficult to cure than compounded rubber, the gases penetrating more quickly in the latter case.

On the motion of J. Brierley, of the Leyland & Birmingham Rubber Co., Limited, seconded by H. W. Hatton, of the Premier Waterproof & Rubber Co., Limited, and supported by F. J. S. Gray, of St. Helen's Cable & Rubber Co., Limited, a cordial vote of thanks was accorded by the guests to Mr. Minton for his hospitality.

THE WATERPROOF GARMENT TRADE.

Considering the extremely wet weather which has prevailed during the whole of July the continued stagnation in the waterproof garment trade and the consequent accumulation of stocks has come as a surprise. People in the rubber proofed garment trade, however, say that wet weather does not usually bring an access of business, their experience being that potential purchasers say that the old coat is good enough for dirty weather and that they usually put off their new purchase until the fair weather that follows in the wake of the foul. By the way the weather is behaving this summer, it rather looks as if the purchase would be put off until the Greek Kalends, but we trust that there will be a turn for the better before long.

Although the making-up trade is by no means busy, the proofing works do not report any slackness, though foreign demand is quiet owing to what are considered excessive prices. The raincoat trade is in a poor way and makers are saddled with large stocks they do not know what to do with. This has come about chiefly on account of the cloth, a large amount of goods having been made entirely of cotton instead of the woolen or union gaberdine which used to be almost universally used and which were really some protection against rain, whereas the cotton article is of very little use. At the present time, however, the old-time gaberdine costs 25 shillings per yard and there is only a limited sale for coats made of it.

RUBBER MACHINERY STOCKS IN DEMAND.

New issues of capital have not been so frequent of late as they were some months back, but Francis Shaw & Co., Limited, has had a successful issue and the same may be said of Vickers, Limited, which, at one time an armament firm alone, is now closely concerned with the rubber industry.

Among recent developments in this line is the manufacture of rubber machinery at the Barrow works and the production of waterproof cloth at the Dartford works, Kent. These works were at first the home of the Clark tire of Australia and have been utilized more recently by Messrs. Vickers for war work.

EXCESS PROFITS DUTY.

A good deal has been said about the Excess Profits Duty now confirmed at 60 per cent for the current year being responsible for the slackness in trade which is apparent in many quarters, but it is much open to doubt as to the degree of influence which this tax has exerted. An interesting point of detail about deduction allowed in computing the profits of private limited companies is the distinction made between the original partner directors who are the real capitalists and other directors, generally heads of departments, who hold a few shares and who have been given the status of directors for certain reasons. The Chancellor of the Exchequer distinguishes the latter by the term employee-directors, which to my mind is a good idea and a useful distinction.

tion, albeit it may not be entirely to the liking of those concerned. Concessions which have been made to small new business will be appreciated by many in the rubber trade, and as for the large old-established concerns we shall probably find that despite their lamentations they will continue to present satisfactory balance sheets.

RUBBER EXPERTS IN STORES DEPARTMENTS.

I have been struck with an advertisement by the London County Council for an assistant in the stores department who understands the chemistry and manufacture of rubber. Candidates are to come direct from the rubber trade and their principal work will be concerned with the purchase and supply of rubber goods. I imagine this to be quite a new departure, the usual procedure being that all sorts of stores are bought by one individual of no technical knowledge who may or may not seek the assistance of a chemist who acts in an entirely subordinate capacity. It has long been in my mind that stores superintendents would be well advised to seek technical advice when arranging contracts for various articles, though I had not imagined the appointment of a whole-time expert for one particular branch of goods.

THE HOT WATER BOTTLE JUDGMENT AGAIN.

In an important assize trial in which many thousands of pounds were involved and which was concerned with the Sale of Goods Act, the writer was interested to hear counsel quote extracts from the hot-water-bottle judgment. In this case, which went to the High Court a few years ago, it was held that the seller of a hot-water bottle gave an implied warranty that the hot water would remain in the bottle and not go into the bed. The case had nothing to do with the rubber, but it appears that the judgment in the water-bottle case is quoted as an important one in its general bearings.

PNEUMATIC TIRES OF CHAR-A-BANCs.

The impending increase in railway fares will drive more travelers on to the road, but there can be little doubt that the monster char-a-bancs in which the so-called poor man spends so much time careering about the country will raise their fares in sympathy. These huge conveyances, which take up the whole of most of our narrower roads and are a constant source of annoyance to owners of private cars, are at present limited in their speed to 12 or 14 miles per hour. It is confidently anticipated, however, that the solid tires at present used will be replaced before long by pneumatics with the result of an increased rate of speed.

MAGNESIA.

An article entitled "Light and Calcined Magnesia" in THE INDIA RUBBER WORLD for July, is not wholly clear. Magnesia, as used in the rubber trade, is carbonate, heavy and light, and calcined, heavy and light. The scientific explanations given are right enough if read as applying to light and heavy and not to light and calcined. In Britain the bulk of the carbonate of magnesia used is the light, which, although of the same chemical composition as the heavy, both being hydroxycarbonates, occupies a far larger volume per unit of weight. This, as the writer of the paragraph points out, has nothing to do with specific gravity, but is concerned with occluded air. Where the magnesia is made by the wet chemical process by precipitating a magnesium salt with sodium carbonate the use of hot concentrated solutions gives a precipitate of heavy magnesia, while cold dilute solutions give the light variety. This being much more bulky requires far more space for production and subsequent drying. In a general way it may be taken that a certain weight of light and heavy magnesia, either carbonate or calcined, will occupy five times as much space for the light as for the heavy. The great bulk of the commercial magnesia used in the British rubber trade is not made by the old precipitation process but by the treatment of dolomite (the double carbonate of lime and magnesia) with carbonic acid gas under pressure. The magnesia goes into solution

as the bicarbonate and is obtained on evaporation in the very lightest form and made over quite free from sulphates.

UNITED RUBBER PRODUCTS CO.

The United Rubber Products Co., which I mentioned in my last correspondence as having acquired the works of G. W. Laughton & Co., Limited, of Croft street, Clayton, Manchester, to work a recent process for the utilization of waste rubber, has come in for some animadversions in "Truth" of July 21. Personally I know nothing of the recent process, so cannot form an opinion as to its value, but it seems to have been too readily assumed that the process is one for reclaiming rubber, which is, of course, as critics have pointed out, by no means a novelty. If it is merely a reclaiming process the literature of the company might be revised with advantage, but it does not indicate that a new reclaiming process is valueless, though most of those which have reached the Patent Office files seem to die of inanition shortly after.

THE RUBBER INDUSTRY IN BELGIUM.

Special Correspondence.

THE COLONIAL EXPOSITION AT ANTWERP.

IT CAN BE SAID that when M. Franck, the Belgian Minister of Colonies, asked the Comité des Fêtes d'Anvers, 1920, to include in its program a colonial exposition, he chose the right time. For, apart from the educational value of an exposition of the vast natural resources of the Congo, it has the higher purpose

HALL OF THE ANTWERP COLONIAL EXPOSITION.

of showing to the thousands of foreigners gathered together at Antwerp from the four corners of the earth, that the horrors of the war and four long years of enemy occupation have not weakened the national spirit of enterprise.

Some of the names connected with the promotion of this exposition will sound familiar to many American rubber men. There is M. Edouard Bungé, head of the Société Anonyme Bungé, Antwerp, and the indefatigable president of the executive committee of the exposition. Lieutenant-Colonel Leon Osterrieth, director-general of the present exhibition and director of many a successful exposition in the past, it will be remembered, was military attaché at Washington during the war. Of the secretaries on the committee, Emile Hendrickx will be recalled as having accompanied Colonel Osterrieth during his stay in America.

The arrangement and appearance of the 40 booths are a credit to all concerned. As might have been expected, rubber and rubber men were very much in evidence. Among the concerns of interest to Americans in the rubber trade, the following were represented: L'Association des Planteurs de Caoutchouc,

Osterrieth & Co., Société Anonyme Bungé, Willaert Frères, G. & C. Kreglinger, Compagnie du Kasai, Grisar & Co., "Belgica" Comptoir Colonial; the last-named company has been particularly active in the planting of *Hevea* in the Congo and has plantations which have entered the productive period.

Of the exhibits, one of the most interesting certainly was a case of samples of *Hevea* from the plantations in the Congo run by the State and by the two companies that have persevered in planting *Hevea*, namely, the Forminière and the Belgica. The samples are said to be of excellent quality and were quoted in Antwerp at as high as 14-15 francs per kilo. It is further stated that in spite of doubting spirits, *Hevea* in the Congo is succeeding. The root disease from which the young trees suffered at first has been stopped and the trees are big yielders of excellent rubber. Many of the 7- to 8-year-old trees are said to have circumferences of over a meter (39.37 inches).

The annual production of plantation rubber in the Congo is estimated to be around 500 tons. And by the way, the estimated output of wild rubber for 1920 is 2,500,000 kilos. In 1917 the yield was 2,659,000 kilos.

All strength to the little country that put up such a brave fight during the great war, and is with equal pluck making strenuous efforts to win its way back to prosperity.

COMPAGNIE BERGOUGNAN BELGE.

The Société Générale des Etablissements Bergougnan, whose headquarters are at Clermont-Ferrand, France, has just established a branch in Belgium known as the Compagnie Bergougnan Belge. Its object is the commerce and industry of rubber and other gums, rubbered fabrics, chemical and industrial products for the manufacture of rubber and other gums, and of all that is connected with that branch of the industry; further, it will manufacture and sell all articles of metal or other substances that are related to the cycle, automobile and general vehicle industry. The capital of 20,000,000 francs is represented by 40,000 shares of 500 francs each, and 20,000 founders' shares.

The first directors are: Raymond Bergougnan, Etienne Clementel, Jean Bergougnan, Albert Galicier, Adrien Josse, Baron Edouard Empain, François Empain, Georges Theunis and Albert Mary.

BELGIUM'S COMMERCIAL REVIVAL.

That Belgium is picking up rapidly is abundantly apparent, and really all the trumps are with her; the sympathy of the world; a rich colony to develop and a thrifty, hard-working population; no Near Eastern question to bother about; no road to India to guard; being such a small country and having suffered so much in the war, she is not expected to take up undesirable burdens and to interfere when she would rather not.

Consequently she is able to concentrate all her efforts on regaining her former prosperity, and statistics show that she is on the highway to success. It is held that of all the European countries, Belgium's condition is the soundest. During the first quarter of 1919, Belgium had an unfavorable trade balance of over 91 per cent; the first three months of this year showed that the adverse balance had been cut to 42.1 per cent.

Her shipping is also picking up; since the war 24 steamship companies have been established in Antwerp; of these 10 have a total capital of 211,500,000 francs. The other 14 each have a capital of less than one million francs.

RESTORING THE ELASTICITY OF RUBBER.

Rubber articles that have become hard recover elasticity if soaked in three per cent carbolic water or three per cent aniline solution. In carbolic water black goods become gray. If it is desired to preserve the black or red color of the goods, that can be done by using a one per cent solution of pentasulphide of potash. This smells unpleasant, but the restoration of elasticity is quite considerable.

THE RUBBER INDUSTRY IN AUSTRIA.

By a Special Correspondent.

MEN closely connected with the conditions in the Austrian rubber industry are inclined to be more hopeful about the economic future of Austria. It seems that the Austrian rubber manufacturers have been able to collect a fairly efficient labor force and will endeavor to specialize in the manufacture of high-class rubber goods requiring special skill for their production. For this kind of work Austria seems to be well equipped and as high prices can be obtained today for practically all articles requiring a large percentage of labor there is hope that Austria may be remunerated for her efforts. Among the principal obstacles to the development of the Austrian rubber industry at the present moment are the frequent internal political crises which are interrupting the slow progress of reconstruction which is being carried out with great energy by the manufacturers.

NOTES FROM GERMANY.

A somewhat peculiar experience is that of the German rubber sole industry. During the war rubber and substitute soles were much in demand. This enthusiasm for rubber footwear has continued all through the first year after the war. Now there is suddenly a falling off in the demand. The manufacturers thought that the decline in orders was due only to the general depression of the market, but it appears now that the German public is not so interested in rubber soles and heels as formerly. Great efforts have been made to retain the business, but notwithstanding, fewer rubber soles are sold and the demand for leather soles increases. Two reasons are given for this occurrence. The first is the comparatively low price of leather following the recent readjustment of hide prices and the second the poor quality of most of the rubber soles manufactured at the present time by the German manufacturers. A contributing cause which is of minor importance is the disinclination of the rubber goods dealers to sell rubber soles in competition with other retailers, such as dry goods stores, etc. The sale of rubber goods is still specialized in Germany and there are quite a number of goods stores dealing in nothing else but rubber articles. These stores are looking askance upon the wholesale distribution of rubber heels and in some cases have refused to handle the goods of factories dealing with other retailers.

The manufacturers of sporting shoes with rubber soles report a heavy decline in orders, due principally to the high prices still ruling. The fact is that the German public has regained its usual understanding of the value of money and is not inclined to spend as recklessly as a few months ago. This naturally has an effect upon the distribution of high-priced goods, and where four months ago any price would have been paid, today the customer will leave the shop and think twice before purchasing.

The Central Union of Surgical Rubber Goods Dealers is firing a broadside at the Commissioner of Imports and Exports against the recent regulation which forces exporters to quote in foreign money units. It seems that the necessity of quoting in foreign money has led to a considerable reduction in foreign orders for German merchandise and that other difficulties have resulted from the regulation. It is, for instance, practically impossible for any German merchant to draw a perfect balance as he never knows how he stands with reference to his foreign credits. The Surgical Rubber Goods Dealers are of the opinion that it should be left to the exporter to say whether he wants to quote in German or foreign money.

The same association has also raised a protest against the recent law imposing a duty of ten per cent on all exports.

GERMAN CRUDE RUBBER MARKET.

A market for crude rubber has been established in Hamburg and rubber importers are again able to quote German prices, subject, however, to frequent changes. The following are the prices ruling the first week of July: *crêpe*, finest light, 33 marks per kilogram; first latex *crêpe*, thick, 33 marks; prime smoked

sheets, 33 marks; hard cured fine Pará, 37.50 marks; Peruvian, 32 marks; black halata, Venezuela, 66 marks; reclaimed rubber, American, gray, 23 marks; white, 22 marks; black, 16 marks.

Much interesting information about conditions in the German rubber industry is contained in the recent report of the Kolnische Gummi-fabrik of Cologne. This firm is engaged principally in the manufacture of elastic bands. With the help of small quantities of rubber obtained from governmental stocks in the beginning of 1919, the works started again, being closed for several years. Later larger supplies of rubber were obtained from England and deliveries have been regular ever since so that the factory is now working at full capacity. While rubber is obtainable at fair prices, there are great difficulties in the deliveries of supplementary materials such as solvents, cotton fabrics and fuel, most of which still have to be imported. With the resumption of international trading relations the factory has been able to obtain good orders, although prices have fluctuated heavily under the influence of the changing foreign money values. An increase of the share capital of this company from 1,080,000 marks to 3,000,000 marks is proposed.

FINANCIAL AND TRADE NOTES.

The Asbest und Gummi Werke Alfred Calmon Aktiengesellschaft of Hamburg has increased its share capital from 4,000,000 marks to 10,000,000 marks.

The Deutsche Linoleum Werke, Hansa, in Delmenhorst, has increased its share capital from 3,400,000 marks to 4,800,000 marks.

Owing to the difficulty of obtaining regular supplies of coal several large industrial enterprises in Germany have recently acquired their own coal mines. Among others, the Continental Caoutchouc & Gutta Percha Co., Hanover, has asked the shareholders for authorization to buy a coal mine in Westphalia.

The Norddeutsche Gummi und Guttapercha Waren-Fabrik, formerly Fonrobert & Reimann Aktiengesellschaft, in Berlin, has increased its capital from 1,500,000 marks to 3,000,000 marks.

C. Mueller Gummiwaren Fabrik, Aktiengesellschaft, Berlin-Weissensee, has increased its capital from 1,100,000 marks to 2,200,000 marks.

The Bremer Gummiwerke Roland A. G., located at Bremen, has changed its name to Bremer Gummiwerke Roland Aktien-gesellschaft. The company has decided to increase its capital from 1,200,000 marks to 2,000,000 marks.

Erich Bonwitt, 68 Chaussee street, Berlin-Britz, is a wholesale distributor of rubber, old rubber, and other similar articles.

NEWS OF THE GERMAN CABLE INDUSTRY.

THE German cable industry, which is one of the most active branches of the German electrical industry, passed through a rather difficult time during the war. As an export industry of considerable importance it severely felt being cut off from foreign markets, and for a while at least, the directors of the cable manufacturing companies were inclined to take a rather serious view of the situation. An improvement took place during the beginning of 1915 when army orders began to pour in, with the result that the industry was soon occupied upon government work almost entirely, a condition that has continued up to the end of the war.

The German cable industry relies for its rubber material entirely upon foreign supplies, and it made only very small use of reclaimed rubber manufactured in German factories before the war. In fact, most of the reclaimed rubber used by the larger German works was of either English or American origin. New rubber was soon practically unobtainable owing to the British blockade, and the electrical industry therefore was compelled to fall back upon substitutes of various characters. Old material was used wherever possible, and a great many other materials were tried with little appreciation, however, from the engineers. So the acquisition of rubber is one of the principal problems of

the German cable industry at the present time. The question has been thoroughly ventilated in German technical journals and associations, and it is generally expected that Germany will not have difficulty in securing the necessary rubber at competitive prices, provided always that the allies do not make true their threat of the Paris Conference, to cut off Germany from the raw material supplies or to supply raw materials to Germany at higher cost than those sold to their own industries. To-day rubber is purchased in small quantities by the German cable industries in London and by way of the Netherlands. Also limited quantities of reclaimed rubber have reached the cable works by way of the famous "hole in the West," the territory now under occupation by the allies which forms a large opening for the introduction of many articles of allied origin.

The high prices that have to be paid for rubber and reclaimed rubber introduced in this manner, have raised the prices of cables very much and there is in fact at the present moment no standard price in Germany for any article, manufactured from imported raw materials. Wages in the cable industry have risen very rapidly since the armistice was concluded and are now, on the basis of international exchange value, approximately three times what they were before the war, and with no prospect for firm rates until a stabilization of the exchange rate of the mark has been effected. The eight-hour day, of course, is an accomplished fact in all cable works, and this, in addition to the very much decreased efficiency of the labor force, has acted to reduce materially the production. There are no special statistics available for the conditions in the cable industry. It has been shown, however, that the average reduction of efficiency of the labor force comprises about five-eighths of the former working performance per employee.

To help maintain prices on a profitable level and to assist individual manufacturers in the purchase of raw materials, especially rubber, it has become necessary to continue the Verband Deutscher Stark Strom Kabel Fabrikanten, which now includes all the cable works of importance, as the formation of associations of this character has been supported by the Government during the war.

The German cable industry is expected to be very busy during the next year. Germany is now executing a very far-reaching program of national electrical power development which is principally based upon power production at specially suitable centres, and the transmission of the power generated in this manner to the points of consumption by way of high tension cables. As some of these giant generating stations will be situated in the Rhineland and power will have to be transmitted as far as Berlin, large cables will be required for that purpose. The German plan of power generation contemplates also the erection of power stations on several hydro-electric sites with the provision that these stations, of which some are already in operation, will be linked up with the large coal-fired generating stations, each supporting the other. This will require also very powerful cables for the exchange of power between the different stations.

This work alone will provide occupation for the cable works of Germany during the next few years. But additional work is provided further by the necessity of renewing the under-sea cables that have either been destroyed by the Allies or taken over as the result of the peace agreement. The renewal of the German international cable lines is at present one of Germany's most difficult modern problems. Everybody in Germany seems to agree that the nation should own its own cable lines in the future. But so far nobody is able to say who shall pay for the new installation and how it will be possible to secure the necessary terminals, as these have been taken over, together with the cables, by the Allies. The cable works, however, are confident that a solution of the problem will be found and that new cables necessary to Germany's renaissance will have to be made by the works.

DEATH OF THREE PROMINENT GERMAN RUBBER MEN.

The "Gummi-Zeitung" announces the death of three men prominent in the German rubber industry. Ch. C. Bohning, director of the Bremer Gummiwerke Roland A. G., died in Bremen, Germany, on July 4, 1920. Before entering the above firm Mr. Bohning was director of the Grottan Section of the Vereinigte Berlin Frankfurt Gummiwaren-fabriken.

Dr. Hugo Cassirer died in Charlottenburg, near Berlin, on the eighth of July, at the age of fifty-one years. He was the founder of Dr. Cassirer and Co., and of the Lincaas Gummiwaren-fabrik, G. m. b. H.

Karl Reithoffer, a member of the well-known firm of the Gummi- und Kabelwerke Josef Reithoffer's Soehne, Vienna Steyr-Trencsen, died in Vienna, on June 22, 1920, following an operation for appendicitis. He was born in 1870. The firm of Josef Reithoffer's Soehne is said to be the oldest rubber works in the world, having been founded in 1811 by J. N. Reithoffer, for the manufacture of rubber thread to be used in elastic woven goods.

TARIFF NOTES.

AUSTRALIA.

AMONG RECENT ADDITIONS to the list of articles that may be admitted into Australia free of import duty under special license for use in the manufacturing of other commodities are machines for applying rubber internal wire tires to wheels, and machines for close-jointing rubber internal wire tires after application to wheels.

INCREASE OF CUSTOMS DUTIES IN BELGIUM.

By a Belgian law dated June 10, 1920, the government was authorized to apply to the specific rates of duty laid down in the Customs Tariff "coefficients of increase," which were not to exceed three in any case. This law was followed by a royal decree dated June 12. The decree became effective on June 21 and will continue in force until June 15, 1921. The coefficient of increase does not apply to *ad valorem* duties. The coefficient of increase is the figure by which the normal tariff must be multiplied to obtain the new rate of duty.

Equivalents.—France, about 19 cents (normal); kilo, 2.2 pounds.

Tariff No.	Article.	Duty in % of Franes.	Coefficient of Increase.
10	India rubber:		
	Raw	Free	..
	Rubber tires:		
	Solid tires	100 kil 65.00	2
	Pneumatic tires:		
	Covers for automobiles and motorcycles:		
	With studded leather band	100 kilos 130.00	2
	Other	100 kilos 116.00	2
	Casings for other vehicles weighing each—		
	Less than 600 grammes	100 kilos 90.00	2
	600 grammes or over	100 kilos 60.00	2
	Tire casings, protectors, etc., composed mainly of rubber, are to be treated as complete corners.)		
	Inner tubes:		
	For automobiles and motorcycles	100 kilos 170.00	2
	For other vehicles	100 kilos 150.00	2
	Manufactures of rubber:		
	33. Rubber belting	100 kilos 30.00	2
	34. Manufactures of asbestos combined or put with rubber (packing), tubes and pipes of rubber, rubber tubes for artificial blood	ind cal 5%	..
64	Elastic tissues mixed with cotton silk, etc., cotton predominating	100 kil 320.00	3

Note.—Rubbered textile fabrics specially manufactured for making cord fillets are free of duty. However, imports of these fabrics can only take place through the custom houses designated for the purpose, and subject to the importers proving to the satisfaction of the customs that the fabrics are really intended for the above mentioned purpose.

DENMARK.

By a decree of the Royal Danish Government of June 29, 1920, the restrictions on the exportation of rubber tires and rubber tubes for motor vehicles have been removed.

GERMANY.

According to the "Deutsche Allgemeine Zeitung," Germany, with the object of regulating its foreign trade, has had recourse to the *ad valorem* system of duties on exports. The duty on all kinds of rubber and rubber goods is two per cent of the value,

which varies according to their quality and importance to Germany.

MEXICO.

The Mexican "Diario Oficial," issue of June 30, 1920, contains the changes in the Mexican schedule of import duties which went into effect July 1, 1920. Of special importance are the reductions in duty on rubberized cloth and waterproof clothing, shown in the following comparative table (the normal value of the Mexican peso is \$0.4985; a kilo is 2.2046 pounds):

Item No.	Article.	New Duty, Pesos per Kilo.	Old Duty, Pesos per Kilo.
703A.	Ready-made clothing of rubberized cloth60	4.00
712	Rubberized cloth of cotton, same duty as cotton cloth of same grade		(*)
712A.	Rubberized cloth of linen, hemp, and similar fibers, wool, or silk, dutiable at 50 per cent of the rate on corresponding cloth		(*)

*Former classification uncertain

The original decree provided for the doubling of the duty on rubber tires for automobiles and trucks. This change, however, was abrogated by the decree of July 12 and the former rates are now in effect.

CONDITIONS IN FRENCH INDO-CHINA.

Special Correspondence.

THE ECONOMIC CONDITION of Indo-China has never been so good as it is at present. The country has progressed, industries are growing, the country's products, among which are rice, pepper, minerals and rubber, are in great demand and the rate of exchange of the piaster, the local coin unit, is high. Altogether there is extraordinary prosperity in this French colony.

In the face of all this it comes as a shock to read in the April number of the "Bulletin du Syndicat des Planteurs de Caoutchouc de l'Indochine," telegrams in which the necessity of a much-reduced rate of exchange is urged if the plantation industries in this country are not to be ruined.

The piaster, a silver coin, had before the war a value of approximately 2.50 francs. At the present time, however, the rate has reached the abnormal figure of 14.50 francs, giving the piaster, which normally is equal to about half an American dollar, a value greater than that of the dollar. The plantation industries, except rice, are suffering severely, for the high value of the piaster makes their products, rubber particularly, two and three times as expensive to produce as the like products from Malaya or the Netherlands East Indies.

As a remedy, the Chamber of Agriculture, Chamber of Commerce and the local Rubber Planters' Association have addressed a letter to the new Governor General, M. Maurice Long, suggesting means of improving the situation. It seems that there is a great shortage of rice throughout the East. Indo-China has a bumper rice crop and can export to the value of 225,000,000 piasters. It is now suggested to levy an export tax of three per cent of the rice, the funds thus obtained to be used to aid agriculturists, rubber planters, etc.

THE RUBBER MARKET AT MARSEILLES.

Letters between a Parisian rubber broker and the President of the Colonial Institute at Marseilles have been published in a recent issue of the "Bulletin des Planteurs de Caoutchouc de l'Indochine," and reveal certain conditions existing in the Marseilles rubber market that are not only detrimental to rubber planters in Indo-China, but will prove a disadvantage to Marseilles as a port of entry for rubber.

The Parisian broker declares that when making rate allowances the local importers from Indo-China give the weight authorized by the sworn weighers. The weighers, however, do not weigh each case in a lot, but give an average weight based on the actual weight of, say 10 per cent of the cases. As this

average is generally too low, this method of procedure spells loss to the purchaser. Another point is this:—rubber from this colony is of an irregular quality and is appraised below corresponding grades of Malayan or Ceylon rubber. Now, it happens that many importers of the Indo-Chinese rubber, considering their mark sufficiently well-known, refuse to take samples from lots offered for sale and offer only samples taken from former lots. This, in combination with the pretty bad reputation of Indo-China rubber, forces an importer, who begins by demanding a price based on the rate for Malayan rubber quoted in London, to sell his goods at a price very much below the London rate and often below the actual value of his rubber.

IMPORTS AND EXPORTS.

According to a recent issue of the "*Bulletin Economique de l'Indochine*," France sent to this colony during the year 1918, rubber goods—chiefly tires—to the value of 1,305,000 francs and weighing 687 quintals (230.46 pounds) against a value of 1,233,000 francs and a weight of 649 quintals during 1917, the figures for 1918 showing an increase in value of 72,000 francs.

From other countries the imports were as follows:—boots and shoes of rubber: 391 quintals, value 313,100 francs in 1918 and 139 quintals, value 111,100 francs in 1917; elastic fabrics: 55 quintals, value 136,800 francs in 1918 against 31 quintals, value 72,200 francs in the previous year. Belting, hose and packing also showed an increase for 1918, the figures being 421 quintals, value 378,800 francs, as compared with 205 quintals, value 184,700 francs during 1917. The most important increase was tires and tubes, the 1918 imports being 403 quintals, value 766,000 francs against only 75 quintals, value 142,500 francs in 1917. Here the difference in favor of 1918 is 623,500 francs. That Japan's share in all this business is considered important, although the amounts are 186 quintals, value 226,000 francs, is seen from the fact that the imports from that country are the only ones to be specially mentioned. The exports of crude rubber follows:

	France. Kilos.	Other Countries. Kilos.	Totals. Kilos.	Total Values. Francs.
1913	168,760	45,200	213,960	876,000
1914	146,000	48,600	194,600	1,695,000
1915	376,100	600	376,700	3,292,000
1916	547,800	700	548,500	5,585,000
1917	930,800	930,800	3,226,000
1918	537,700	537,700

The drop in exports during 1918 was more than made up for during 1919, when total exports of rubber amounted to 3,518,969 kilos. Of this 2,834,853 kilos of plantation rubber went to France; 7,084 kilos to London; 32,816 kilos to Hongkong; 939 kilos to San Francisco; 354,106 kilos to Shanghai; 259,822 kilos to Singapore. Besides this 29,349 kilos of wild rubber were shipped to Marseilles.

THE RUBBER TRADE OF INDIA.

BURMA.

RUBBER is fast becoming one of Burma's principal exports; 1,419,000 pounds being shipped in the fiscal year 1918-19 as against 2,634,000 pounds in 1917-18, and 2,301,000 pounds in 1916-17. Most of these shipments went to the United Kingdom. Rubber goods to the value of \$6,505; \$18,538; and \$11,292 were imported from the United States to Burma during the fiscal years 1917, 1918 and 1919 respectively. The decrease in 1919 was due chiefly to import and export restrictions. Declared exports of India rubber from Rangoon to the United States in 1918 totalled 4,480 pounds valued \$2,777; in 1919, 112,215 pounds valued \$57,142.

There are 500 mills or factories in Burma, which offer a possible market for rubber belting. Though the British are said to control the greater part of this business, competition from American manufacturers is beginning to be felt. The imports of

rubber, balata, and fabric belting were, in 1918-1919, £76,600 compared with £38,000 in 1914-1915.

In the hope of restoring the rubber industry in Burma, the Government has decided to advance 100 rupees at 6½ per cent interest for every acre planted with rubber. During the first six months of 1919, Burma's largest ten plantations produced 1,142,383 pounds of rubber. Exports in the same period amounted to 2,206,527 pounds, valued at \$836,052.

CALCUTTA.

Rubber articles to the value of \$1,565,216 were imported at the port of Calcutta during 1917-18. The following year, 1918-19, shows a slight increase in value, the amount totaling \$1,586,529. Raw rubber exported from Calcutta in 1917-18 amounted to \$2,024, while in 1918-19 the amount decreased to \$1,864.

SOUTH AMERICAN NOTES.

PERU.

MANUFACTURERS of rubber to the value of \$241,398 were imported into Peru in 1918 as against \$162,923 in 1917. Exports of crude rubber from Peru in 1917 were: Condurango, \$91,836; crude, \$2,812,640; during 1918, Condurango \$47,497; crude \$1,573,646. Declared exports of rubber to the United States from Callao during 1917 were 3,760 pounds of Condurango, valued \$375 and 8,568 pounds of raw rubber valued \$4,435. From Mollendo 705,684 pounds of rubber valued \$393,536 were exported to the United States in 1917, while in 1918 the amount decreased to 25,112 pounds valued \$12,066.

NICARAGUA.

Exports of crude rubber from Nicaragua amounted to \$258,852 in 1917 as against \$42,619 in 1918. This decrease was due to the restrictions placed upon this product and the decline of the market. Declared exports of rubber from Corinto to the United States in 1917 were 224,429 pounds valued \$107,158; in 1918, 77,000 pounds valued \$25,479.

PIRELLI BUYS JAVAN ESTATE

It is reported that on June 10, 1920, the Rubber & Tea Estate Boesi Sari Lendra, covering about 2,100 acres, and planted for the greater part, was sold for about \$540,000 to Pirelli & Co., Milan, Italy, manufacturers of tires, rubber goods, insulated wire, etc. The estate is situated about 30 miles from Garoet, Java.

The Italian company acted through Dr. Luigi Sarcoli, a doctor of chemistry, who will establish himself in Java and act as estate manager. He, together with Alfredo Calcagni, also connected with the Pirelli factory, arrived in Java with a staff of 30 employees.

The estate will now be operated exclusively for supplying raw material to the plant in Milan.

Buying up more estates was at first considered, but owing to difficulties with foreign exchange, nothing appears to have come of this yet.

ALGERIA RUBBER IMPORTS.

Rubber goods were imported into Algeria in larger quantity in 1919 than in 1918, the totals being 421 metric tons valued at \$1,846,624 in 1918 as against 610 metric tons valued at \$2,731,143 in 1919. The quantity of imports of rubber and gutta percha goods from the United States in kilos (1 kilo equals 2.2046 pounds) for the year 1919 is given provisionally in the table below:

Fountain pens	Kilos	318
Shoes	37
Tires	16,400
Other rubber manufactures	300

The Rubber Trade in Japan.

By Our Regular Correspondent.

THE JAPANESE RUBBER INDUSTRY.

IT WAS about thirty-four years ago that the Japanese rubber industry started. N. Tasaki, owner of the Tsuchiya Rubber Works, which later became the Mitatsuchi Rubber Manufacturing Co., was the first man in Japan to learn the process of rubber vulcanization. Since then Japanese rubber manufacturing has made considerable progress. Some manufacturers learned their methods from foreign engineers, some from books on rubber manufacturing, and thus more than thirty years have passed. At present there are 130 factories in Tokio.

A general survey of the rubber factories in Japan indicates that all divide themselves into five heads:

1. The Mitatsuchi Rubber Manufacturing Co. line.
2. The Meiji Rubber Factory line.
3. The Rubber Co. line.
4. The Dunlop and the Ingram line.
5. Other lines.

The Tsuchiya Rubber Works, afterward the Mitatsuchi Rubber Manufacturing Co., was established thirty-four years ago at Kamiyoshi-cho, Asakusa, Tokio. Messrs. T. Tasaki and H. Tsuchiya were the owners of this factory. They were of the Matsumae clan, Hokkaido, and fishing and refloating wrecked ships, by using diving apparatus and rubber hose, was their occupation. Their equipment required frequent repairs, especially the rubber parts. In order to mend these they purchased at Yokohama scrap rubber discarded by the Navy Office, dissolved it in volatile oil and made a jelly-like material with which the damaged parts were plastered.

As their fishery did not prosper, they established a factory at Kamiyoshicho, Asakusa, Tokio, for manufacturing diving dresses. This factory was the first one in Japan. In those days these diving dresses were sold only to the railway and steamship companies, so that the demand was soon exhausted. Then they undertook to become repairers of these dresses, also manufacturing stamp-stands for the Department of Communication.

It was about 1882 or 1883 that rubber became known a little among the Japanese people, but owing to the deficiency of manufacturing knowledge and experience, the rubber industry in Japan was still in its infancy. As no other rubber factory had been established in Japan in those days, the Tsuchiya Rubber Co. held a monopoly. Owing to the limited demand for their goods, however, it suffered from financial difficulties, yet bravely continued the business until a method of vulcanization was learned on December 2, 1886; this day it was decided to incorporate. In 1889 bulbs and packings were added to the list of goods and in the following year some rubber manufactures were exhibited at the Domestic Industrial Exhibition. The factory was removed to Narihira-cho Honjo, in the same city in 1892, and in 1893 the company became a partnership and the name was changed to the Mitatsuchi Rubber Manufacturing Co. Besides former productions, manufacture of ebonite and suction hose was now begun. During the Chino-Japanese war, they profitably met the requirements of the War and Navy Offices. Since then the rubber manufacturing industry in Japan has made constant progress. In 1897, rubber balls were manufactured, and in three years enough were produced so that the imports of foreign-made balls became unnecessary. In those days, rubber balls were mainly imported from Germany, the total amount being \$120,000 a year. At present, a great number of them are exported.

The company now known as the Fujikura Insulated Wire & Cable Co., Tokio, was a pioneer in the production of rubber-covered wire. The progressive policy of Mr. Fujikura, who founded the industry in 1885, has been continued since his death, in 1902, by T. Matsumoto, the present president of the company.

The concern adheres closely to the standards of the British Cable Makers' Association and the Japanese Government to insure the maximum of efficiency in the products.

Much of the success of the company is also due to Kenzo Okada, nephew of the late Mr. Fujikura, who became a partner in the factory in 1901. He will be remembered by not a few rubber men in the United States where he worked for several years acquiring a knowledge of the industry.

In 1887, K. Yoshida, getting a water bottle of rubber from abroad, endeavored to manufacture this line of rubber goods, and at last, with the assistance of F. Komae and his brother, R. Yoshida, who were then students of the Doshisha University in Kyoto and had many chances of reading foreign books on rubber, worked out a manufacturing method. By 1889, there were but few factories in Japan. K. Suzuki, who learned the method of making rubber solution in naphtha, began to manufacture stamp-stands, with the capital furnished by S. Nomoto; but unfortunately his undertaking did not go well. Mr. Mori also in these days inaugurated a shop with a view of making rubber seals.

The Tokio Rubber Manufacturing Co., a limited partnership, was established in 1892. G. Matsumoto and S. Morita were the capitalists. They engaged Mr. Saito as an expert and were doing a brisk business when the engineer died and the factory had to suspend. In 1896 this company was purchased by K. Kamijo and the firm name was changed to the Tokio Rubber Factory, K. Kamada being engaged as engineer.

In 1901 G. Yonei, who died last year, bought this factory and changed the name of the company to the Meiji Rubber Factory. This is one of the oldest and largest rubber factories in Japan.

The Tokio Rubber Co. was established in 1899, H. Tanaka induced S. Nomoto, Z. Fujikura and E. Shibusawa to assist the company, and engaged Mr. Ogihara, an engineer educated in America, with the object of manufacturing rubber goods. Unfortunately the goods were not successful and therefore they bought over Mr. Arihara, of the Mitatsuchi Rubber Manufacturing Co., to manufacture "Tabi" soles; but this second attempt also did not bear good fruit.

A few years later Messrs. Y. Yashida and Hanaki, who were then employed by the Meiji Rubber Factory, purchased the Tokyo Rubber Co. and reduced its capital from \$150,000 to \$75,000.

The Nippon Rubber Co. was established in 1900 by the combination of two companies, with W. Yamasaki as director. One was the Yashida Rubber Factory, which had been established at Hisakata-cho, Tokio, by the cooperation of Messrs. S. Yoshida and W. Yamasaki in 1896; the other, the Nippon Rubber Co., established at Hashibacho, Asakusa, in 1900, R. Motohashi being the director.

In 1900, the Meiji Rubber Factory engaged Mr. Ferguson, an Englishman. In those days there was no factory which kept a foreign expert.

This new attempt gave a little animation to the Japanese rubber manufacturing industry, but a large development was still far in the distance. The following figures show the amount of the business in those days:

CRUDE RUBBER IMPORTS.

Year.	Pounds.	Value.
1900.....	107,439	\$52,179
1911.....	154,924	68,332

A little after the Russo-Japanese War, the Dunlop Rubber Co., Far East, Limited, was organized in 1907. At first it imported rubber goods from the Dunlop company in England and the

Ingram Co. in America; but a few years later, a factory was established at Kobe for the manufacture of bicycle tires.

The Japan Ingram Co. was established by the son of Arthur Ingram, with the object of making rubber goods.

NEW RUBBER CORPORATIONS IN JAPAN.

The following corporations were established in Japan during 1919:

Kyodo Rubber Co., Limited. Capital, \$500,000, one-fourth paid in. Office, at Sugamo, Tokyo.

Miyakawa & Co. This shop was formerly operated by Mr. Miyakawa, but was incorporated owing to the increase of business.

Hinomaru Wire Rubber Co., Limited. Capital, \$500,000. Office in Osaka.

Americo-Japanese Rubber Industry Co., Limited. Capital, \$500,000, one-fourth paid in. Office, Yurakucho, Tokyo.

Towa Rubber Co., Limited. Capital, \$100,000, one-fourth paid in.

Godo Rubber Industry Co., Limited. Capital, \$100,000, one-fourth paid in. This company is to manufacture cycle tires, tubes and other rubber goods. Office at Minamisenju, Tokyo.

Hinode Rubber Co. Capital, \$15,000. Office at Shitaya, Tokyo.

Nikkwa Rubber Industry Co. Capital, \$5,000.

Rubber Balloon Manufacturing Factory. Capital, \$250,000. Office at Asaki, Tokyo.

Tokio Rubber Co., Limited. Capital, \$1,250,000. Office at Ochiai, Tokyo.

Yamato Rubber Industry Co., Limited. Capital, \$250,000, one-fourth paid in. Office at Kameido, Tokyo.

Koyama Rubber Commerce and Industry Co., Limited. Capital, \$50,000, all paid in. Office at Kanda, Tokyo.

Osaka Tabi Sole Co., Limited. Capital, \$250,000. Office in Osaka.

Daiichi Rubber Factory. Office at Kameido, Tokyo.

Nippon Ebonite Co. Office at Mikawashima, Tokyo.

Hokoku Rubber Co., Limited. Capital, \$500,000, one-fourth paid in. Office in Osaka.

Osaka Rubber Sole Tabi Manufacturing Co. Capital, \$12,000. Office in Osaka.

Izumo Rubber Works. Capital, \$15,000. Office at Kitashinagawa, Tokyo.

Nichifuku Rubber Manufacturing Factory. Office in Tokyo.

Yukita Rubber Industry Co., Limited. Capital, \$75,000, one-fourth paid in. Office in Saitama Prefecture.

Imperial Cycle Co., Limited. Office in Tokyo.

Fukushima System Rubber Shoe Co., Limited. Capital, \$100,000, one-fourth paid in. Office at Nihonbashi, Tokyo.

Central Rubber Industry Co., Limited. Capital, \$1,000,000, one-fourth paid in. Office in Tokyo.

JAPANESE NOTES.

FROM all accounts it seems that Japan is endeavoring to dominate trade in the East. That she is succeeding to a certain extent is acknowledged, and among the growing exports may be noted rubber goods. Japan is also trying to maintain her position in shipping, but the English have recovered their prestige quicker than Japan thought possible, and America is a competitor to be reckoned with. In spite of this, the large steamship companies entertain extensive plans for the future, including improvements in the harbor of Tokio.

JAPAN AND THE NETHERLAND EAST INDIES.

Japan is particularly friendly with the Netherland East Indies. The "Dutch East Indian Archipelago" announces that "the Japanese squadron has been cordially received at Macassar and other ports in the Archipelago. Officers and crews were regaled everywhere." It is not a one-sided affair, for "reports about the

hearty welcome extended to the Dutch squadron in Japan have been received here with great satisfaction." Also, the "South Sea Association" at Tokio has decided to hold an exhibition of produce and manufactures of the Netherland East Indies. The Dutch authorities at various points in Japan are cooperating heartily. Among the principal exhibits, rubber, of course, takes an important place. A final quotation from the above publication follows here: "The Japanese Government has again invited some prominent Dutch gentlemen to visit Japan. The visit will probably take place in 1921."

JAPAN'S IMPORTS.

Japan's imports of crude rubber in 1919 exceeded 24,000,000 pounds, an increase of 48 per cent over 1918. Domestic manufactures include automobile and bicycle tires, rubber cloths, and mechanical and industrial rubber goods. Imports of rubber manufactures were chiefly waste or old rubber, woven belts, hose, plates, sheets, tubes, waterproof sheeting, insulating tape, insulated wire, threads, strips, bands, rings, washers, rods, and cords. The imports of dental rubber alone amounted to \$85,000. Japan's rubber manufacturers have received large orders from Siberia.

THE RUBBER INDUSTRY IN CEYLON.

Special Correspondence.

MUCH SPACE in local publications is being devoted to the question of a Ceylon planters' union. Opinion is fairly unanimous as regards the need for some change in the conditions of the planters, but there is quite a lot of more or less interperate argument about the need of a union. The more conservative minds think that the existing Ceylon Planters' Association is fully capable of meeting the needs of all the planters, particularly if it were reorganized. However, a great number of planters, probably influenced by the success of planters' unions in Java and Sumatra and of the Incorporated Society of Federated Malay States Planters, desire a separate association.

From the mass of correspondence on the subject it appears that among the sympathizers with the idea of a union there is a very strong objection to the name union. Opposers of the entire scheme are afraid of Bolshevism. A few believe that the present salaries would be adequate if rates of exchange were normal and will be sufficient once normal progress reduces the cost of living all around, and therefore suggest a temporary bonus to help the planters over the abnormal period. That this last suggestion is entirely impossible from the planters' point of view, is evident from their demands, which include increases of pay; home leave with full pay plus passage money at the end of a fixed period of service; sick leave, and pensions.

Prior to the present union scheme, an estate superintendents' association had been organized and was widely supported. Fortunately for the success of the newer scheme, the superintendents' association has now been amalgamated with it.

COUNCIL REFORM.

At the Ceylon Association dinner given recently in London to the Governor of Ceylon, who is on a visit to England, the Governor declared that he would urge that the mercantile community should again have representation in the legislative council and also in his own privy council. The Ceylonese should have a greater voice in the government of Ceylon.

EXPORT DUTY ON RUBBER.

At a recent meeting of the legislative council of Ceylon the question was asked whether the Government when preparing the budget for 1920-21, would consider the possibility of reducing, if not withdrawing entirely, the export duties on tea and rubber imposed during the war to provide funds for carry-

ing on the works usually debited to loan account. No relief was promised.

CEYLON DURING 1919.

During 1919 conditions were more favorable for rubber, though the high rate of freight and the abnormal exchange rate were serious factors in the cost of production. The price for the first grades of plantation rubber fluctuated considerably, falling from 2s. 2d. in January, to 1s. 7d. in June to rise again to 2s. 11d. at the end of the year.

Reports from Ceylon show no serious increase of pests or diseases during the year 1919, though brown bask had been giving trouble on some of the older estates.

The budget for 1920-21 disclosing that not only is the excess profit tax to be retained but is to be increased to 60 per cent, has caused considerable disappointment here.

GENERAL NOTES.

The present freight rate of rubber from Ceylon to the United Kingdom is 165 shillings.

The General Rubber Co. will shortly be moving into new premises above the Eastern Bank, Limited, in Chatham street, Ceylon.

It is reported that a Badulla planter has left Ceylon for North Borneo to open 200 square miles of rubber, 5,000 acres at a time.

It appears that the Holland-America Steamship Co. proposes to begin a service of freight boats from Europe to the East with an extension to America. Colombo will be a port of call.

The new Dixon line is to run regularly from Colombo. It is understood that Messrs. Struthers and Dixon will establish a branch executive office at Singapore, better to handle the ports in the neighborhood.

The Ellerman & Bucknall Steamship Co., Limited, is starting a regular monthly service from Montreal to Port Said, the Soudan, Aden, Bombay, Colombo, Singapore and Java.

THE RUBBER INDUSTRY IN MALAYA.

Special Correspondence.

THE OUTLOOK for rubber is fully occupying everybody's attention. The general opinion seems to be that conditions are favorable enough and that all would be well were it not for the labor problem. Others look at the large new planted areas and talk of overproduction and a slump in the market, while many take comfort in the huge amounts of rubber used in America, in the increasing use of motor-driven vehicles and the consequent demand for tires of every kind, and have no fear of the future. Those who talk of overproduction are told that diseases are carrying off great numbers of trees and that all that is planted is not destined to produce. Not a very consoling answer, whatever the implication may have been.

THE AMERICAN BUGABOO REVIVED.

Some years ago there was a great outcry here from a certain section of the planting community against the American invasion of rubber lands. That bugaboo was eventually buried when the Rubber Lands Enactment was enforced. However, it has appeared again in new form and stalks about in the guise of American financiers who are gambling with rubber. At all events, a letter in the "Malayan Tire & Rubber Journal," May 31, 1920, signed by "Help Yourself," expresses astonishment at the rubber growers of Malaya, Ceylon, Java and Sumatra who are allowing American buyers to control the price of rubber. He, too, believes in a rubber shortage; also is apparently anxious that the price of rubber should be correspondingly high, and suggests a combination of rubber growers of the Mid-East to control the output and the price of rubber.

RUBBER PRICES.

The "Straits Times," May 27, says in an editorial: "From a source which on many occasions we have found most reliable,

we learn that there is a quiet movement on foot to take advantage of the present low prices of rubber and to buy up control of the local companies. The big manufacturing interests are said to be at the back of the movement, and the reason given is that, in their opinion, rubber is of much greater value than the current prices would lead one to assume." As will be noted, the "Straits Times" mentions no names and talks of no manufacturing interests in general—English, American, any kind. It also counsels shareholders to hold on to their shares.

It further says: "Malaya produces nearly three-fifths of the world's total output, so that it is within the power of the Malayan companies to force prices up at any time they please." It also advises the industry to perfect its organization and to get experts to study the price question.

ALTERNATE-DAILY TAPPING.

In the life of an individual or a community there always comes a time when a panacea is looked for that will cure all the ills existing. No small section of the planting community is regarding alternate-daily tapping as such a cure-all. It will solve the labor problem, because half the number of tappers can be used; the health of the trees will be promoted, because less bark will be consumed, and some believe that it will even prevent brown bask; overproduction and consequent low prices will be prevented, because there will be a reduction in output amounting to about 40 per cent.

It must be admitted that while estate managers are eager for a solution of labor troubles, they do not like the idea of a reduced crop. Therefore, it has been suggested to combine alternate-daily tapping with the practice of doubling the length of the tapping cut, using a half spiral or basal "V" cut. Such a system would probably still help in the labor problem, but the chance of overproduction and low prices remains the same, so that this suggestion will hardly be popular. In fact, the Rubber Growers' Association has already squelched it by recommending alternate-daily tapping without increasing the length of tap.

The association states that alternate-daily tapping will eventually prove the cheapest system.

THE CHINESE PLANTERS' ASSOCIATION.

A Chinese planters' association of Malaya has been formed at Penang, somewhat on the lines of the Planters' Association of Malaya. In the past, the latter association has often been handicapped because it could reach only a certain number of managers. It is expected that now the two associations together will be able to exercise greater control over the rubber industry of Malaya and it is hoped that they will cooperate as far as possible. Particularly in view of the labor shortage and the increasing demands of estate coolies, mostly Chinese, who in some cases get as much as \$1.50 a day, it is hoped that the new association will have a beneficial effect.

MALAYAN NOTES.

It is reported that the assistant chemist of the local Department of Agriculture, S. W. Bunker, B. Sc., A. I. C., has resigned to take up a new billet with higher remuneration elsewhere. Much regret is expressed by the rubber industry of Malaya, which complains that the low salaries paid by the local government have caused seven good men to resign since 1917 and to go to such organizations as the R. G. A., the Holland-America Co., and the General Rubber Co.

The possibility of growing cotton in Malaya is receiving a good deal of attention. It has been suggested that as a catch crop for one year for rubber it would also be useful.

J. BREMNER AND A. R. COX, PARÁ, BRAZIL, HAVE FORMED A partnership under the name of Bremner & Cox, succeeding the former firms carried on by them individually as buyers and exporters of rubber and other Brazilian products, and will continue in the same business. The partnership dates from June 1, 1920.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED JULY 6, 1920.

- N**O. 1,345,406. L'ethersoupe. M. C. Rimmer, London, Eng.

 1,346,683. Glove with rubber membrane vulcanized upon outer surface only of body with circular ribbed portions on inside of hand and finger surfaces, to facilitate gripping objects. J. N. Reynolds, Atlantic, Iowa. (See *The India Rubber World*, March 1, 1920, page 365; also, this issue, page 817.)
 1,346,692. Resilient tire of alternate layers of fabric and rubber with circular cushion in center. A. Balaguer, Mariano, Havana, Cuba.
 1,346,766. Resilient tire. J. A. Prince and A. L. Gilles, Nice, France.

REISSUES.

- 14,913. Repair vulcanizer. J. C. Heintz and G. Ruf, Cleveland, Ohio. Said Ruf assignor to said Heintz. (Original No. 1,262,598, dated April 9, 1918.)

ISSUED JULY 20, 1920.

- 1,346,834. Resilient red of rubber with core of cork granules bonded together. C. E. McManus, New York, N. Y.
 1,346,841. Removable heel lift with device for fastening in place. R. W. Fadden, Kansas City, Mo.
 1,346,912. Rubber hand stamp. F. Pitman, East Kew, Victoria, Australia.
 1,346,945. Pneumatic tire. C. Drouet, Houston, Tex.
 1,346,991. Rubber ball having interior circular metallic strip held at one side of center. G. M. Tatum, Media, Pa.
 1,347,021. Grafting-tube with rubber cushion. F. S. Field, Atlanta, Ga.
 1,347,030. Grafting-tube. F. A. Getalder, Pittsburgh, Pa., assignor to The Ohio Varnish Co., Cleveland, Ohio, a corporation of Ohio.
 1,347,144. Demountable rim for tires. W. J. Bruce, Sterling, Ill.

- 1,347,259. Amount certification rubber check stamp for banks. J. Derscha, Flint, Mich.
 1,347,398. Douche can, with nipple provided with rubber sleeve. F. J. O'Rourke, New York City.
 1,347,439. Soft rubber ring tire casing seal. G. H. Budd, Salt Lake City, Utah.

REISSUES.

- 14,920. Windshield cleaner. L. H. Morse and J. J. Tracy, Cleveland, O.—said Morse assignor to said Tracy. (Original No. 1,339,216, dated May 4, 1920.)

ISSUED JULY 27, 1920.

- 1,347,679. Pneumatic tire without inner tube. E. B. Brown, assignor to O. W. Fort, and H. R. Taylor—all of Los Angeles, Cal.
 1,347,775. Insulating, waterproof sole for use on boots and shoes. H. M. Burr, Middletown, and G. J. Ingraham, West Hartford, assignors to The Omo Manufacturing Co.—all of Middletown, Conn.
 1,347,800. Fountain pen. P. E. Wirt, Bloomburg, Pa.
 1,347,847. Tire casing. H. E. Grabau, Long Island City, N. Y., and A. C. Schwartz, New York City—said Grabau assignor to said Schwartz.
 1,347,848. Tire casing fabric and method of manufacture. H. E. Grabau and A. C. Schwartz, New York City—said Grabau assignor to said Schwartz.
 1,347,864. Suspensory with rubber tubing straps. S. A. Marker, Newark, N. J.
 1,347,901. Fountain pen having device for retarding flow of ink. W. T. Fitzpatrick, Waterloo, Ia.
 1,347,950. Reinforced pneumatic tire. G. Hofmann, assignor to Hofmann-Morgan Rubber Co.—both of Chicago, Ill.
 1,347,953. Resilient tire. J. A. Horne, Newark, N. J.
 1,347,993. Articulated effigy of prehistoric animal, having outer covering of elastic material. H. M. Dawley, Chatham, N. J.
 1,348,005. Device for inserting plugs in tires. H. R. Hirt, Trenton, N. J.
 1,348,094. Life-preserver helmet. D. Del Re, Iron River, Mich. (Original application divided.)
 1,348,122. Demountable rim for tires. P. S. Larson, Beloit, Wis.
 1,348,136. Shoe with rubber and fabric welts sole. E. W. Dunbar, assignor to Apsley Rubber Co.—both of Hudson, Mass.

THE DOMINION OF CANADA.

ISSUED JULY 6, 1920.

- 201,504. Wheel with pneumatic tire having enlarged edge. W. E. Beasley, Cheddington, County of Bucks, and W. Beedle, Watford, County of Hertford, inventors—both in England.
 201,553. Resilient cushion wheel. J. W. Fowler, Grey Lynn, Auckland, New Zealand.
 201,558. Pneumatic tire. T. Gordon, Vancouver Island, B. C.
 201,573. Puncture proof, composite pneumatic tire. E. T. Lampard, Detroit, Mich., U. S. A.
 201,590. Demountable split rim for tires. P. L. Munford, Birmingham, Ala., U. S. A.
 201,624. Inflatable life preserver. F. Stebbing, Chicago, Ill., U. S. A.
 201,699. Removable tire tread. The Snap-on Tread & Tire Co., assignee of J. C. Burlock—both of New York City, U. S. A.

ISSUED JULY 13, 1920.

- 201,774. Inflatable life preserver. L. Farr, El Portal, Calif., U. S. A.
 201,781. Hard rubber fountain brush. C. A. Garvey, Clayton, Missouri, U. S. A.
 201,795. Stocking supporter with chest and elastic back sections. H. Keys, Ellensburg, Wash., U. S. A.
 201,905. Lather brush with bristles set in rubber and brush-containing handle. The American Safety Razor Corp., Brooklyn, assignee of M. B. Behrman, Tompkinsville—both in New York, U. S. A.
 201,915. Running-board mat. The Essex Rubber Co., assignee of R. H. Phillips—both of Trenton, N. J., U. S. A. (See *The India Rubber World*, June 1, 1920, page 589.)

ISSUED JULY 20, 1920.

- 201,948. Rim for pneumatic tires. W. J. Stark, Vancouver, B. C., and S. R. Ramsey, Burbank, Wash., U. S. A., co-inventors.
 202,030. Demountable rim for tires. A. Mentzer, Duluth, Minn., U. S. A.
 202,070. Rubber-protector. H. Hasselbeck, Mannheim, Grand Duchy of Baden, Germany.
 202,128. Resilient tire with pneumatic tube. The Veltung Steel Tire Co., assignee of E. Veltung—both of New York City, U. S. A.
 202,136. Demountable rim for tires. B. W. Brackett, assignee of W. F. Traves—both of Cleveland, O., U. S. A.
 202,139. Demountable rim for tires. B. W. Brackett, assignee of W. F. Traves—both of Cleveland, O., U. S. A.

THE UNITED KINGDOM.

ISSUED JULY 7, 1920.

- 142,440. Device for beating furs, etc., with rubber mounts upon levers. A. L. B. 189 rue de Valenciennes, Paris, France. (Not yet accepted.)
 142,449. Capsule or closure with rubber disk. C. Columbian, 46 avenue de la Republique, Bondy, and J. B. M. Liarsou, 27 rue du Poteau, Paris—both in France. (Not yet accepted.)
 142,467. Steering and balancing device for heavier-than-air craft, captive balloons, boats, submarines, etc. The Goodyear Tire & Rubber Co., 1144 Broadway, New York City, assignee of R. H. Upson, 219 Shawnee Path—both of Akron, Ohio, U. S. A. (Not yet accepted.)

- 142,511. Teeth-cleaning and gum-massaging appliances with rotatable thin rubber discs. R. M. Withycombe, Wyomine, McQuarrie street, Sydney, Australia. (Not yet accepted.)
- 142,617. Removable mat made of S. Howell, Vinegar, Manchocho, Chidambara, Penderbore.
- 142,718. Cushion wheels. A. A. Thornton, 8 Quality street, Chancery Lane, London. (Monmouthshire Spring Tire Co., 1018 Federal Road, East, Building, London, Weymouth, S. S.)
- 142,720. Brags to be with elastic breast-band. E. W. Patton, 51 A. Debeaux, Adelaide, Macdonald. (Tire Co., 160 Fifth avenue, New York City, U. S. A.)
- 142,731. A rebound bed with metal frame embedded in it. J. H. Overton, 167 Spring street, Trenton, New Jersey, U. S. A.
- 142,768. Device for leveling rubber trees. S. J. Holly, 27 Kings avenue, Muswell Hill, London.
- 142,774. Balls or caps and like headwear stiffened by a compressed fabric of rubber and canvas, etc. J. F. Key, 93 Hope street, Glasgow, Scotland.

ISSUED JULY 14, 1920.

- 142,774. Metal-studded fabric and leather tire cover. Società Fabbrica di Pneumatici e Accessori, Immacolata Forno, 1 Via Arcademica, Turin, Italy, assignees of G. Parenti and V. Messini. (Not yet accepted.)
- 142,987. Head-caps with sponge-rubber pads. E. T. P. Goodyear, Colley Corner, Reigate Heath, Surrey.
- 143,129. Rubber tire with reinforced cavities closed with plugs of vulcanite, the cavities containing either air or sponge-rubber. J. Carnes, 64 Clifton Road, Northwood, London.
- 143,135. Resilient cushion tire. Naamloze Vennootschap Oetecrotaatschap, Holland. (Tire Exploitant van Uitvindingen, 209 Keizersgracht, Amsterdam, Holland.)

ISSUED JULY 21, 1920.

- 143,307. Reinforced tire. E. Lees, White Cross, Weymouth, Dorset, H. W. Kiddle, Hill House, Burnham-on-Crouch, Essex, and T. H. Hirst, 3 William Avenue, Wyke Regis, Dorset.
- 143,359. Cushion tire with soft rubber body and hard rubber base. S. Hill-Wood, Park Hill, Hayfield, Derbyshire, and W. T. Clifford-Adair, Marjoriebank, Laurel Road, Barnes, London.
- 143,408. Pneumatic tire. H. Wade, 111 Hutton Garden, London. (A. L. Cole, 164 Auburn street, Auburndale, Newton, Mass., U. S. A.)
- 143,434. Golf ball comprising a number of rubber-wound or other balls, with central weights, embedded in gutta percha, balata, or rubber, the whole being rubber-wound. A. F. Dimmock, 14 Princess Square, Harrogate, Yorkshire, England.
- 143,490. Fountain pen. C. Leoncini, 67 Via Ricassoli, Florence, Italy. (Not yet accepted.)

ISSUED JULY 28, 1920.

- 143,644. Reinforced inner tube. H. N. Wayne, 150 South Alexandria avenue, Los Angeles, California, U. S. A.
- 143,649. Reinforced pneumatic tire. P. Harder, 13 Nordre Frihavsgade, Copenhagen, Denmark.
- 143,725. Hand bag or satchel, reinforced material, supported by collapsible frame. (For description see THE INDIA RUBBER WORLD, April 1, 1918, page 413.) J. J. Riccio, 29 Washington Parkway, Brooklyn, New York; 83 Washington avenue, Grantwood, New Jersey; and A. Hornel, 6 Charles street, New York 311 in U. S. A.
- 143,801. Leather carrying pouches. T. H. Bull, 10 Mortimer Road, Ealing, London.
- 143,802. Donkey nozzle. J. W. Mellersh Jackson, 28 Southampton Building, London. (J. Rose, 229 Halsey street, Brooklyn, New York, U. S. A.)
- 143,861. Device for closing punctures in tires. R. Brunner, Islikon, Thurgau, Switzerland. (Not yet accepted.)

GERMANY.

PATENTS ISSUED, WITH DATES OF ISSUE.

- 325,522. (July 2, 1915.) Substitute for solid rubber tires. Gummiwaren fabrik Louis Peter Aktien-gesellschaft, Frankfurt-on-Main.
- 325,572. (December 1, 1918.) Heel protector made of a rubber band. Alexander Unger, Budapest, Hungary.
- 325,573. (December 1, 1919.) Rubber sole with interchangeable walking surface. Peter Beiering, 26 Schiller place, Bielefeld.
- 326,448. (April 1, 1916.) Inner tube with textile insert in cover. Alfred Schirke, 18 Lauenburgerstrasse, Berlin-Wilmersdorf.
- 326,449. (February 6, 1920.) Cover for cycle tires. Ludwig Klein, 22 Leonoldstrasse, Lichtenberg, and Paul Henke, 11 Kamminerstrasse, Charlottenburg.

DESIGN PATENTS ISSUED, WITH DATES OF ISSUE.

- 744,308. (May 20, 1920.) Rubber patch for shoe heels with special walking surface. Otto Roebel, 8 Neuer Graben, Dortmund.
- 744,309. (May 20, 1920.) Rubber heel patch. Otto Roebel, 8 Neuer Graben, Dortmund.
- 744,401. (May 21, 1920.) Shoe protector made from new or old rubber outsoles, or old pneumatic or solid tires. Martin Roth, 72 Von Quadtstrasse, Köln-Deutz.
- 744,436. (May 21, 1920.) Hose for air pump. Franz Plath, 39 Goldstrasse, Dresden.
- 744,734. (June 3, 1920.) Rines cut from rubber of used automobile, motor, and cycle tires. Dr. Strauch and Papeler, Hannover-Döhren.
- 744,831. (May 1920.) Leather-studded rubber heel. Chr. Eifer, Haubersbrunn, and O. A. Schorndorf, Württemberg.
- 744,832. (May 12, 1920.) Leather-mounted rubber heel without corners. Chr. Eifer, Haubersbrunn, and O. A. Schorndorf, Württemberg.
- 745,343. (June 1, 1920.) Cover for rubber heels. Kurt Feige, 45 Sprengelstrasse, Berlin.
- 745,634. (June 16, 1920.) Rubber heel with space for insertion of leather. W. Rothaupt, 9 Nussbreite, Eisenberg.
- 746,097. (June 18, 1920.) Rubber heel with center of hard material. Friedrich Theilmann, 54 Waldstrasse, Frankfurt-on-Main.
- 746,176. (June 23, 1920.) Exchangeable shoe and heel cap of rubber with metal center. Josef Vitassi, Pola Via G. Venezia Giulia.
- 746,204. (June 7, 1920.) Finger ring with rubber insert for turning book pages. Ernst Gentner, 50 Gr. Burgstrasse, Lubek.
- 746,299. (June 1920.) Rubber heel. Wood-Milne, Limited, London.
- 746,300. (June 22, 1920.) Rubber heel. Wood-Milne, Limited, London.

TRADE MARKS.
THE UNITED STATES.

- No. 113,809. The word GABLE—rubber tires for motor cars and other vehicles. E. R. Killen, London, Eng.
- 113,820. Representation of a bull's head, all beneath the words BUZZARD and the words TRADE MARK within white circle surrounded by a black circle containing the words VIOLET RAY SELF VULCANIZING PATCH in white letters all beneath the words BUZZARD BULL PATCH patches for repairing inner tubes, rubber hot water pipes, downers, etc. H. R. Hoild, Buffalo, N. Y.
- 118,275. The word BUCKY—rubber tires and tubes. The Rotary Tire and Rubber Co., Zanesville, O.
- 118,355. Representation of a tire above the word SKIDDEE—anti-skidding rubber tires. P. Sanger, 1000 Broadway, New York City.
- 118,930. The word PARCO—tires. The Pan-American Rubber Co., Milwaukee, Wis. (See THE INDIA RUBBER WORLD, March 1, 1920, page 366.)
- 119,233. The words JIFFY JACK—waterproof bathing suit bags. J. D. Farkas, New York City. (See THE INDIA RUBBER WORLD, August 1, 1919, page 638.)
- 119,351. The word LONDON—shoes of leather, rubber or fabric, or combinations of these, for men, women and children. London Shoe Co., New York City.
- 120,010. The word NOVART—drawing outfits including rubber erasers. H. C. Mitchell, New York City.
- 120,436. The word SURETY—inner tubes. Surety Tire and Rubber Co., St. Louis, Mo.
- 121,683. The word GLOBESTOPS—brake linings. United & Globe Rubber Co., Trenton, N. J.
- 121,795. The words LUCKY STRIKE—artificial balls of rubber, etc. The Thomson-Diggs Co., Sacramento, Cal.
- 122,743. The initials A.W. in outline, the letters within a double-bordered diamond—vulcanizers, molds, and other equipment for rubber manufacturers. The Williams Foundry and Machine Co., Akron, O.
- 123,675. Representation of scroll bearing the words WALKER'S GOLDEN WALKERITE—asbestos and rubber sheet packing. J. Walker & Co., Ltd., London, Eng.
- 123,676. The word LIPAKITE—asbestos and rubber steam and hydraulic packing. J. Walker & Co., Ltd., London, Eng.
- 123,677. The words DAWDY LIPAKITE—asbestos and rubber steam and hydraulic packings. J. Walker & Co., Ltd., London, Eng.
- 123,748. Representation of a house made of pens, within a double circle, standing on a scroll bearing the words THE PEN HOUSE—fountain pens and stylographic pens, etc. W. J. May & Co., Ltd., East Twickenham, Eng.
- 124,086. The word DELARE—rubber, leather, canvas and balata belting, rubber and metallic hose and hydraulic packing, and pneumatic tires. Delaware Electric and Supply Co., Wilmington, Del.
- 124,695. Representation of label bearing the words HEAD OF THE LAKE and within a white oval a picture of a bridge over a body of water connecting two cities—arm bands, garters and suspenders. Simon Hargrave, Queens, Minn.
- 124,827. Representation of a white-outlined black panel bearing in white the words "EVEN-READY" SHAVING BRUSHES and the silhouette of a man's face, with the words "EVEN-READY" in a safety razor—shaving brushes with bristles set in hard rubber. American Safety Razor Corp., Brooklyn, N. Y. (See THE INDIA RUBBER WORLD, April 1, 1920, page 413.)
- 126,615. The words HET FI—rubber and fiber sheet packing. The Continental Supply Co., St. Louis, Mo.
- 127,724. The words KLEINERT—sanitary rubber sheets, rubber dams, sanitary aprons and belts, etc. I. B. Kleinert Rubber Co., New York City.
- 127,726. Representation of a maltess cross bearing the word KLEINERT suspended from a scroll bearing the words THE BEST—sanitary rubber sheets, rubber dam, sanitary aprons and belts, etc. I. B. Kleinert Rubber Co., New York City.
- 128,496. The word COMMANDER—fabric and rubber belting and diaphragms for paper mill vats and rubber hose reinforced with fabric or metal. The B. R. Goodrich Co., New York City.
- 128,948. The letter A with outline of a spade spot—hard rubber rods, sheets and tubes. American Hard Rubber Co., Hempstead, N. Y.
- 129,677. The word BALLMATIC—pneumatic cells for filling pneumatic tires. W. H. Richards, Knoxville, Tenn.
- 130,092. The word MAGNUM—tires. The Dunlop Rubber Co., Ltd., London, Eng.
- 130,286. The word RAMBLER—inner tubes. The Ohio Rubber Co., Cincinnati, O.
- 130,481. The words LISTER-MILN—chewing gum, etc. Listerated Gum Corp., New York City.
- 130,646. The words VIEWWAY—shoes of leather, rubber and fabric and combinations of these. Cuetara Bros., New York City.
- 130,873. Representation of a shield bearing two T's and the word QUALITY in a panel containing the words FOR DRYERS REASONS, the panel serving as a base for the words TRI-TEX—hathing caps, etc. Blum Bros., Chicago, Ill.
- 130,977. Representation of a state bearing the words BOY'S SHOES in white letters and the face of a boy silhouetted against a white oval—suspenders, garters, arm-bands, belts, etc.
- 131,337. The word WIKALASKI—quoted—erasers, shields and garters. I. B. Kleinert Rubber Co., New York City.
- 131,472. The word PITCHER enclosed within a conventional outline—zinc, etc. The Eagle-Picher Lead Co., Cincinnati, O.
- 131,474. The word PITCHER enclosed within a conventional outline—chemicals and pigments for the rubber trade. The Eagle-Picher Lead Co., Cincinnati, O.
- 131,526. The words 1080—erasers, the figures 1080—erasers of rubber or rubber composition. E. Faber, Brooklyn, N. Y.
- 131,580. The word SYDUS—rubber boots and shoes, rubber overshoes, and rubber-soled canvas shoes. Hood Rubber Co., Watertown, Mass.
- 131,603. Black isosceles triangle with one side horizontal across the top—brake linings. Staybest Manufacturing Co., Philadelphia, Pa.
- 132,181. The words NO-WAY enclosed in a double-bordered diamond—dust caps for pneumatic tire valves. J. Just, Syracuse, N. Y.
- 132,445. The words AIR-PEPS—rubber or fiber soles and heels. Pioneer Rubber Inc., New York City. (See THE INDIA RUBBER WORLD, April 1, 1920, page 434.)

- 132,634. The word **ROLLICKERS** within an oval shoes made of leather, canvas and rubber. S. Freiburger & Bros., Fort Wayne, Ind.
133,217. The word **SKINCO**—suspenders. J. A. Harps, Greenfield, O.

THE UNITED KINGDOM

- 392.978. Representation of a seal bearing the words NEAL SON in the subject and around it the words DANIEL NEAL & SONS, Patent Office, between two concentric circles—rubber or gutta percha pens, pens and pencils. (Address for service in the United Kingdom, 16 87-89 Edgware Road, London, W. 2, and 124-126 Kensington High street, London, W. 8.)
- 392.978.1. Representation of the words NEAL SON, DANIEL NEAL & SONS, between two concentric circles—rubber or gutta percha ball pens, pens and pencils. (Address for service in the United Kingdom, 16 87-89 Edgware Road, London, W. 2, and 124-126 Kensington High street, London, W. 8.)
- 392.997. The word DANIEL NEAL & SONS, Belgium. J. (Address for service in the United Kingdom, care of A. W. Langner, 16 87-89 Edgware Road, London, W. 4.)
- 392.992. The word SPORTING—game balls and sporting goods. I. A. Fowler, 16 St. Nicholas street, and 73 Northergate, Aberdeen, Scotland.
- 392.993. The word KICK—game balls and sporting goods. I. A. Fowler, 16 St. Nicholas street, and 73 Northergate, Aberdeen, Scotland.
- 392.994. The word WHIPP—golf balls. I. A. Fowler, 16 St. Nicholas street, and 73 Northergate, Aberdeen, Scotland.
- 392.995. The word WAP—foorballs. I. A. Fowler, 16 St. Nicholas street, and 73 Northergate, Aberdeen, Scotland.
- 392.996. The word BOUNDARY—golf balls and sporting goods. I. A. Fowler, 16 St. Nicholas street, and 73 Northergate, Aberdeen, Scotland.
- 392.997. The word BOUNDARY—golf balls and sporting goods. I. A. Fowler, 16 St. Nicholas street, and 73 Northergate, Aberdeen, Scotland.
- 392.998. Representation of two vertically lined diamonds on each side of the letter G within a wreath formed of two conventionalized leaves tied with ribbon bow—rubber tires. The B. F. (Address for service in the United Kingdom, care of W. Langner, Stevens & Parry, 88-90 Chancery Lane, London, E. C. 2.)
- 401.004. The word LUXORA—rubber and gutta percha goods not included in classes other than No. 40. Ingram Brothers, Limited, 1 Woodstock Buildings, London, W. C. 2.
- 401.651. Representation of a quilt pen crossed obliquely by the words BALON DE POCHE "PLUME"—deflatable rubber balls, included in Class 49. Emblissime, Cognier & Bureau, 23 rue des Filles du Calvaire, Paris, France. (Address for service in the United Kingdom, care of Haselinge, Lake & Co., 28 Southampton Buildings, London, W. C. 2.)
- 401.875. The word AERIAL—stationery and typographic pens included in Class No. 39. A. F. Tero, 26-27 Hatton Garden, London, E. C. 1.
- 401.894. The word LEWCOs—textile-covered, rubber-insulated electric light and telephone wires. The London Electric Wire Company and Smiths, Limited, 7 Playhouse Yard, Golden Lane, London, E. C. 1.
- 402.182. Representation of a 6-pointed star within a tire, giving out rays of light between the points and bearing the words LEWCO, a word, LEWCO, a word, and gutta percha goods, except tobacco pouches, not included in classes other than No. 40. F. Longdon & Co., Limited, 17 Agard street, London, E. C. 4.
- 402.887. Representation of a quill pen crossed obliquely by the words "NIGGER" SYLVIA—typographic pens. The Wyvern Fountain Pen Co., 143-144

- 26,541. The word UNIVERSAL—rubber, tires, tubes, reliners, patches, tobacco pouches, invalid rings, ice bags, football bladders and accessories. Ames-Hollen Mfg. Co. ready, Limited, Montreal, Quebec.
- 26,586. The word MAGNUM—tires (automobile, bicycle, motorcycle and solid), rubber belting, garden hose, packing, heels and soles, golf balls and rubber goods. Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario.
- 26,587. The word PERICLES—tires (automobile, bicycle, motorcycle and solid), rubber belting, garden hose, packing, heels and soles, golf balls and rubber goods. Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario.
- 26,730. Representation of a fanciful figure showing a globe encircled by stars and a triple circular border, together with the words: THE NEW YORK N. Y.—belting, hose, packing and tires. The Manhattan Rubber Co., Passaic, N. J., U. S. A.
- 26,747. Representation of a fanciful figure of a helmet intended to represent the Shakespearean characters, Prince of Tyre, and the words: "PRINCE, PRINCE OF TYRE, SHAKESPEARE THE TYRE." The Dunlop Rubber Co. Limited, Dunlop House, Albany street, London, N. W. 1, England.

DESIGNS

THE UNITED STATES.

- N 55,585 Tire. Patented July 6, 1920. Term 7 years. G. E. Batchelor, Forest Hills, N. Y.
- 55,586 Tire cover. Patented July 6, 1920. Term 14 years. R. D. Behm, Marion, O.
- 55,588 Tire tread. Patented July 6, 1920. Term 3½ years. W. O. Bruce, Port Clinton, O.
- 55,600 Tire. Patented July 6, 1920. Term 14 years. T. Follen, La Fayette, Ind.
- 55,606 Tire. Patented July 6, 1920. Term 14 years. C. W. Green, assignor to The Bowling Green Rubber Company—both of Toledo, O.
- 55,611 Tire tread. Patented July 6, 1920. Term 7 years. C. O. Henderson, assignor to Henderson Tire and Rubber Corp.—both of Columbus, O.
- 55,612 Tire tread. Patented July 6, 1920. Term 7 years. C. O. Henderson, assignor to Henderson Tire and Rubber Corp.—both of Columbus, O.
- 55,627 Blection board. Inventing a man seated behind a desk with the leaning against the end of it. Patented July 6, 1920. Term 7 years. H. J. Mahin, New York City.
- 55,630 Tire. Patented July 6, 1920. Term 14 years. R. P. McElrath, Galewood, O.
- 55,728 Tire. Patented July 6 1920. Term 14 years. E. A. Tinsman, W. Willoughby, O, assignor to E. A. Tinsman, Cleveland—both in Ohio.
- 55,729 Tire. Patented July 6, 1920. Term 14 years. E. A. Tinsman, Willoughby, assignor to W. C. Owen, Cleveland—both in Ohio.
- 55,730 Rubber shoe. Patented July 6, 1920. Term 14 years. N. E. Touseley, Belmont and A. H. Whorf, assignors to Hood Rubber Co., all of Watertown, Mass.

Review of the Crude Rubber Market.

THE CURTAILMENT in tire production that commenced in July was continued during August and is now at the lowest level known in the history of the industry. This means that 8,000 tons of crude rubber consumed monthly in tires must be carried over until conditions change. The industry as a whole, however, is in strong hands, and competent to cope with the unusual situation.

Depression ruled in the crude rubber market during the first week of August, when small interest was shown by manufacturers or dealers other than small lot buying for immediate requirements. The report of another liquidation in the rubber importing business further depressed the market, resulting in a new low level of 29½ cents for both latex crepe and smoked sheet ribbed, spot rubber.

Quiet conditions continued throughout the month, with slight price advances, due to contract covering on the part of short interests that gave support to a market technically weak through lack of manufacturers' business. The situation is top-heavy. Rubber is constantly going into storage in New York, 20,000 tons being the reported figure, and factory store rooms are filled with rubber.

Arrivals during July were 15,884 tons, compared with 17,965 a year ago. Total arrivals for seven months ended July 31, 1920, were 167,773 tons, compared with 131,694 tons last year. Future arrivals will be less and less, as buying has been restricted in producing centers and surplus stocks stored by the large holders, who are abundantly prepared to meet the temporary contingency.

Spot and future quotations on standard plantation and Brazilian sorts at the first and last of the past month were as follows:

PLANTATIONS. August 2, first latex crepe, spot, 30 cents; October-December, 34½ cents; January-June, 39½ cents.

August 26, first latex crepe, spot, 31 to 31½ cents; October-December, 34 cents; January-June, 38 to 38½ cents.

August 2, ribbed smoked sheets, spot, 29½ cents; October-December, 34 cents; January-June, 39 cents.

August 26, ribbed smoked sheets, spot, 30 to 30½ cents; October-December, 33 to 33½ cents; January-June, 37 cents.

August 2, No. 1 amber crepe, spot, 29 cents.

August 26, No. 1 amber crepe, spot, 28 to 29 cents.

August 2, No. 1 rolled brown crepe, spot, 25 cents.

August 26, No. 1 rolled brown crepe, spot, 24 cents.

SOUTH AMERICAN PARÁS AND CAUCHO. August 2, upriver, fine, spot, 34½ cents; islands fine, 32 cents; upriver coarse, 22 cents; islands coarse, 20 cents; Cameté coarse, 18 cents; caucho ball, 23½ cents.

August 26, upriver fine, spot, 31 to 30 cents; islands fine, 28 cents; upriver coarse, 21½ to 22 cents; islands coarse, 19 cents; Cameté coarse, 17 cents; caucho ball, 22 cents.

RECLAIMED RUBBER.

August business in reclaimed rubber has continued to be quiet and in about the same volume as the previous month. Transportation facilities have improved somewhat, with the result that deliveries are being made more promptly, although delays are still experienced. The tire production curtailment has to a certain degree affected this market, and is reflected in fewer inquiries from solid tire makers. Prices on all grades are practically the same as a month ago.

NEW YORK QUOTATIONS.

August 26, 1920.

Prices subject to change without notice.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Peers, broker in crude rubber and commercial paper, No. 1 Liberty street, New York City, advises as follows:

"During August the demand for commercial paper has been very limited, and almost entirely from out-of-town banks, rates ruling at 8 to 8½ per cent for the best rubber names."

COMPARATIVE HIGH AND LOW NEW YORK SPOT RUBBER PRICES.

	August.

*Figured to August 26.

AMSTERDAM RUBBER MARKET.

JOOSTEN & JANSSEN, Amsterdam, report [August 14, 1920]:

In the beginning of the week prices of rubber showed a further downward movement and the tendency remained quiet. There was a fair demand, but at moderate prices for most of the parcels were offered, but declined to sell, and when they could dispose of their lots at satisfactory prices, they made use of this opportunity, in consequence of which there was after all a good turnover. Only slow and then there was any business on the terminal market; prices remained practically unchanged. At the close prime *Hevea* on spot is quoted at f. 1.12; October, f. 1.12; December, f. 1.15; March, f. 1.16; with sellers; buyers, 2 cents lower.

ANTWERP RUBBER MARKET.

GRISAR & CO., Antwerp, report [July 30, 1920]:

The market tendency continues feeble in consequence of the absence of orders for the United States. Prices have still further declined, and little business was done. Closing prices were as follows: Spot, July, 1s. 9½d; August-September, 1s. 9½d—1s. 10½d; fine Para, 1s. 10½d—1s. 10½d; January-March, 1s. 10½d.

Statistics for the week were as follows: Arrivals, 1,047 tons; sales, 627 tons; stock, 24,405 tons against 27,602 in 1919. A small quantity of African rubber was sold, 263 kilos of red Congo Kasai I and II, at 7.50 francs; 651 red Congo Kasai, Butala grade, at 5.50 francs; 1,760 kilos Congo Plantation *Hevea* and some *Funtumia* at second price.

Arrived per S. S. *Matoba*: Various, 3,125 kilos. Stock on hand, about 755 tons.

Weak reports from London caused the local futures market price to decline 0.70 francs; at this new rate, buyers have the advantage. Transactions amounting to only 30,000 kilos were made. Closing quotations, each month: August-July, 9.50 francs. Tendency, quiet.

SINGAPORE RUBBER MARKET.

GUTHRIE & CO., LIMITED, Singapore, report [July 15, 1920]:

Further London quotations, news of a demoralized New York market and rumors of a failure in that quarter, have had a considerable weakening effect on our market since we last reported and the attendance at the opening of the weekly rubber auction yesterday was small. The earlier catalogs were more or less neglected, but later a moderate demand sprang up, on sellers showing a desire to meet buyers on such lots as they were interested in. The bidding was confined to standard and lower grades, off quality lots of sheet and crepe being unsaleable.

Fine pale crepe sold up to 73 cents (two lots sold at 73½ cents) and 2½-ribbed smoked sheet fetched 73½ cents (one lot in cases sold at 74½ cents and four lots loose at 74 cents) showing declines of 3½ and 3 cents, respectively. Brown crepes shared in the general decline and were 3/6 cents cheaper on the week, while dark and hairy crepes dropped 2/4 cents. The tone of the market may be judged from the fact that only 420 tons were sold out of a catalogued quantity of 904 tons.

The following is the course of values:

	In Singapore per Pound	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked, .72c @ 73½c	1/10½ @ 1/11	
Sheet, good ribbed smoked, .58 @ 72	1/6½ @ 1/10½	
Crepe, fine pale, .72 @ 73	1/11½ @ 1/11½	
Crepe, good pale, .58 @ 72	1/7 @ 1/11½	
Crepe, fine brown, .58 @ 63	1/7½ @ 1/8½	
Crepe, good brown, .53 @ 56½	1/5½ @ 1/6½	
Crepe, dark, .43 @ 44½	1/4 @ 1/5½	
Crepe, bark, .40 @ 45	1/3 @ 1/3½	

*Quoted in Straits Settlements currency: \$1 = \$0.567 United States currency.

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official report from Singapore states that the export of cultivated rubber from Straits Settlements ports in the month of June amounted to 1,665 tons (of which 1,976 tons were transhipped). This compares with 15,617 tons in May and 5,059 tons in the corresponding month last year. The total exports for the first half of the current year amounted to 79,435 tons, as against 82,725 tons last year and 42,180 tons in 1918. The following are the comparative statistics:

	1918.	1919.	1920.
January, tons	4,302	14,404	13,125
February,	2,334	15,661	17,379

April,	6,584	10,848	15,720
May,	13,587	13,845	15,617
June,	6,515	5,059	1,663
Totals,	42,180	82,725	79,435

FEDERATED MALAY STATES RUBBER EXPORTS.

An official report from Kuala Lumpur states that the exports of plantation rubber from the Federated Malay States for the month of June amounted to 2,040 tons, compared with 7,627 tons in May and 7,094 tons in the corresponding month last year.

The total exports for six months in the current year were 55,475 tons, against 50,717 tons for the corresponding period last year and 40,557 tons in 1918. Appended are the comparative statistics:

	1918.	1919.	1920.
January, tons	7,588	7,163	11,119
February,	6,830	10,869	9,781
March,	7,709	10,677	9,524
April,	7,428	7,664	8,375
May,	5,851	7,308	7,627
June,	5,161	7,094	2,040
Totals,	40,557	50,717	55,475

(Compiled by The Rubber Association of America, Inc.)

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THE INACTIVITY that has featured in the rubber scrap market is fundamentally due to the general curtailment of tire production and a consequent stagnation in crude rubber. Reclaimers appear to be well stocked with scrap and are not interested as customary at this time in Fall deliveries. Dealers have shown little interest in present prices that are all practically nominal quotations.

BOOTS AND SHOES. All grades are from $\frac{1}{4}$ to $\frac{1}{2}$ cent lower than last month, depending on the willingness of the seller to make concessions. An average price for boots and shoes, delivered, is around 6.25 cents.

INNER TUBES. These have declined about $\frac{1}{2}$ to 1 cent throughout the list, since a month ago. Holders have asked 14 to 14½ cents for No. 1 tubes, delivered.

TIRES. Prices are from $\frac{1}{4}$ to $\frac{1}{2}$ cent lower than last month, standard auto tires being quoted around 2½ to 3 cents, delivered. There has been very little interest shown in the other sorts, mechanicals being particularly lifeless.

QUOTATIONS FOR CARLOAD LOTS DELIVERED.

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

AMERICAN COTTON has shown a steady decline during August that was due to the excellent prospects for an increased crop, together with the uncertainty regarding consumption, as rumors of manufacturing curtailment were persistent.

From 40 cents quoted on August 2 for middling uplands spot cotton, the market slowly declined to 32.50 cents, the quotations on August 23. Quiet conditions prevailed until the close of the month, with spot quotations around 32 cents for middling uplands.

The Acting Secretary of Agriculture on July 21 signed the pink boll-worm quarantine order, applicable to Louisiana and Texas. It is effective August 1.

ARIZONA COTTON. As this is the period between crops, very little can be reported until the market for the new crop opens. Tentative quotations on the new staple are placed at 80 to 90 cents.

EGYPTIAN COTTON. A bumper crop is expected. The official acreage this season for Egyptian cotton is 1,827,888 feddans. This shows an increase of 254,226 feddans over the acreage in 1919, and is the largest ever planted in Egypt, the previous record being 1,755,270 feddans in 1914. One feddan equals 1,038 acres. The record of the past eight years, including 1920, is as follows:

1920	1,827,888	1916	1,655,512
1919	1,573,662	1915	1,186,003
1918	1,315,572	1914	1,755,270
1917	1,677,308	1913	1,753,094

Quotations on August 23 were 90 cents to \$1 on Sakellarides, and 60 to 70 cents for uppers.

COTTON FABRICS. The market for all cotton fabrics used by the rubber trade is practically dead. Cotton goods can not be sold in quantities, even at reduced prices, because of unsettled market conditions. Fabric mills have caught up on orders and are looking for business, but the rubber trade is not interested in buying cotton goods at this time; in fact, many manufacturers are offering to sell surplus stocks. The following prices are largely nominal.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS. NEW YORK.

THE DEMAND for rubber compounding pigments combined with that of the paint manufacturing industry has stimulated an increase of production in all of the principal lines. This increase is expected to continue for another year. The shortage in the supply of barytes is being sharply felt since it has seriously limited the production of such products as floated barytes, blanc fixe and lithopone, all of which are important in both the rubber and paint industries. Both the United States and Canada are being thoroughly searched for new workable deposits of crude barytes as a basis for future increased output. The present shortage is being relieved in a small degree by importations of

German crude. Labor and transportation difficulties are gradually disappearing from the situation.

Regarding supplies in general, the present weakness of the market is due to accumulation of stocks in the hands of sellers and the lack of money to carry over this temporary period. The importing or manufacturing of any of these chemicals has not declined, and in many cases higher prices are being asked for later and future shipments by the manufacturers, as reflecting the real cost to produce these items.

ANILINE. The demand for aniline oil has decreased considerably. Spot stock declined steadily in price several cents during the month and was weak at 31 cents.

BARYTES. There has been no change in the general barytes situation. Facilities for production are overtaxed and output is hampered by labor and transportation difficulties. There will be a scarcity for some time affecting the lithopone and blanc fixe markets.

BENZOL. The market is very firm. Producers are sold up on contracts at 33 cents per gallon for 90 per cent and 35 cents for the pure grade. Export demand is reported to be heavy.

BLACKS. The manufacturers are operating at full capacity and the demand is sufficient to absorb all the production. There has been a reduction in the contract price of carbon black from 15 cents to 12 cents.

CHINA CLAY. This material is in good demand at steady prices. Imports are not heavy and are quickly absorbed.

TIRE FABRICS

JENCKES SPINNING COMPANY

PAWTUCKET RHODE ISLAND

AKRON OFFICE
407 Peoples Savings & Trust
Co. Building.

CARBON BISULPHIDE. Production is fully taken and the price remains firm at 8½ cents.

CARBON TETRACHLORIDE. The market has held strong the entire month with a moderate and distinct advance in price to about 14½ cents spot.

DRY COLORS. The demand has been active and prices steady, especially in Spanish red oxide and ultramarine.

LITHARGE. The demand has been good and prices steady at 11½ to 12½ cents. Consumption has been above normal.

LITHOPONE. Manufacturers are doing all they are able to meet the demand and make up the shortage. Next year will bring a decided increase in production with the starting up of new plants now under construction. Limited amounts are arriving from Belgium.

SUBLIMED LEAD. Consumption is heavy and production steady, although there are delays in delivery. Poor rail transportation service is a strong market factor and the price of 10 to 10½ cents will probably hold for some time.

SULPHUR. Price and demand have continued steady.

SOLVENT NAPHTHA. Supplies are scarce and firm at 30 cents a gallon in carload lots.

WHITING. Producers are unable to meet the demand. No reduction in price is probable until the short supply is remedied.

ZINC OXIDE. Producers are sold up. The industry is still expanding. The demand is fully up to production and is liable to continue so for some time. Imports of zinc oxide are not arriving in large amounts. Prices remain unchanged.

EAR DRUM PROTECTOR FOR OCEAN SPORT.

A little device that can be worn with comfort and without danger by those who delight in ocean sports, such as high diving, swimming, water polo, and the like, consists of two soft rubber disks mounted on a stem. These cling to the outer ear cavity, keeping the ear-drum protector in place, and permitting easy insertion and removal while, at the same time, preventing the protector from falling out. When in place the "Ocean" ear-drum protector is invisible. The protector comes in one size, which fits any ear, due to the elasticity of the rubber of which the disks are composed. The "Ocean" ear-drum protector is sold on display cards containing two dozen pairs neatly packed in small boxes attached to the card. (Safety Ear Drum Protector Co., 102 Lexington avenue, New York.)

"OCEAN" EAR DRUM PROTECTOR.

A HANDY REPAIR DEVICE.

The little invention pictured here in sectional view will, it is claimed, prevent throwing away a tire which has blown out. The "Dobbins" blow-out chains are attached when the tire is deflated, and the broken fabric and rubber are drawn together when inflated. The chains do not shift their position and are, it is said, as efficient for repairing a blow-out near the rim as in any other part of the tire. They are particularly designed for Fords and other light-weight cars and are made in two styles, for clincher and straight-stroke tires. With each chain is packed an inner patch which is to be placed directly over the hole or cut, on the inside of the shoe, with the sticky side next the casing. This device is easily attached, no tool other than an ordinary screwdriver being required. Full directions accompany the chains. (American Chain Co., Inc., Bridgeport, Connecticut.)

DOWN-SS-BLOW-OUT CHAINS.

EMERGENCY MARKET BULLETIN

Published by THE INDIA RUBBER PUBLISHING CO., No. 25 West 45th Street, New York

NOVEMBER 1, 1919

ANNOUNCEMENT

AS THE RESULT of the strike of pressmen, feeders and paper handlers who have repudiated existing contracts, THE INDIA RUBBER WORLD of November 1, 1919, is delayed. The issue is ready for printing and will appear as soon as our press room is again in operation. Meanwhile this emergency bulletin containing market reviews and quotations as of October 25 is issued as a supplement. While it will reach subscribers ahead of the November 1 number, it will form an integral part of that issue in order to maintain the continuity of the market record. Thus the needs of those who have contracts based on THE INDIA RUBBER WORLD quotations will be met during the emergency. Nor will there be interruption of a service which has been maintained for thirty years.

The controversy which delays publication is between those who believe that a contract should be scrupulously adhered to and a relatively small group who regard a contract as a mere scrap of paper. With nearly two hundred other leading New York publications THE INDIA RUBBER WORLD is an unwilling victim of an internal disagreement between bodies of organized labor brought about by irresponsible local leaders. Among those who prize their honor in this matter are not only the publishers and employing printers, but a large percentage of the employees, notably compositors, who have declared that they will stand by their agreements. Meanwhile our staff and correspondents are gathering and preparing the news of the world's rubber industry as usual, and at the earliest possible moment this will reach subscribers in the customary form.

REVIEW OF THE CRUDE RUBBER MARKET.

NEW YORK.

THROUGHOUT OCTOBER the rubber market has been very firm, with a steady and improving demand from the factories that has raised the price of plantation rubbers both here and abroad. The fluctuations in prices have been within narrow limits. At the close of the month prices were being strongly maintained. The Brazil market has been practically dead, the increase of production keeps the price down; it has become so unimportant that dealers take little interest in it. The market for guayule and balata has also been quiet. Prices for plantation and for South American rubber at the beginning and toward the close of the month are shown in the following quotations:

PLANTATION HEVEA. September 27, first latex crepe, spot 50-51½ cents, October-December 50¼ cents, January-March 51 cents, January-June 51-51½ cents, July-December, 1920, 52 cents, October 24, spot 53 cents, futures 53 cents, July-December, 1920, 53½ cents.

September 27, ribbed smoked sheet 49½ cents, October-December 49¼ cents, January-March 50 cents, January-June 50 cents, July-December,

1920, 51 cents, October 24, spot 52 cents, futures 52 cents, July-December, 1920, 52½ cents.

September 27, No. 1 amber crepe, spot 47 cents, October 24, spot 49-50 cents.

September 27, clear thin brown crepe, spot 46 cents, October 24, spot 44-46 cents.

September 27, No. 1 roll brown crepe, spot 36½ cents, October 24, spot 40-41 cents.

SOUTH AMERICAN PARA AND CAUCHO. Spot Prices: September 27, upriver fine 54 cents, islands fine 47 cents, upriver coarse 33¼ cents, islands coarse 21½ cents, Cametá coarse 22 cents, caucho ball 33½ cents. October 24, spot prices practically unchanged.

NEW YORK QUOTATIONS.

RECLAIMED RUBBER.

The reclaimed rubber market has shown marked improvement the past month. Boot and shoe reclaims have been in strong demand due to activity in the carriage cloth, automobile topping and insulated wire trades. There has been slight improvement also in the call for tire reclaims by the mechanical goods trade. Prices remain unchanged from last month's quotations.

THE MARKET FOR RUBBER SCRAP.
NEW YORK.

THERE has been hardly any change in the rubber scrap market since a month ago. Manufacturers have been buying in small lots, the interest being centered around boots and shoes and standard auto tires.

Price changes in the list since last month show a quarter of a cent advance in boots and shoes, a decline of one cent in standard white auto tires and three-eighths in solid truck tires, otherwise the list is unchanged.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

IN OCTOBER, after hovering around 32 cents for a time with sharp fluctuations, the spot price for middling uplands cotton advanced steadily and reached 36.60 cents on October 24. Speculation was based on the conviction that the crop would be even shorter than the government estimate and that the quality would be poor. Rain and bad weather spoiled the cotton and interfered with picking the cotton in season, while the insect pests abounded, the boll weevil appearing farther north than ever before. The demand is very great and the prospect is that prices will be extremely high.

EGYPTIAN COTTON. The supply of Egyptian cotton has been larger than was expected for the crop was good, though the staple was shorter than usual in many cases, owing to the native trick of cutting off the water in order to force the boll to open early. The high price offered offset in some degree English competition.

From the first to the middle of October, prices advanced sharply but later in the month the market fell off, medium Sakellarides being quoted 58 1/2 cents and medium uplands at 56 cents.

AMERICAN-EGYPTIAN. Arizona has yielded the largest crop yet produced, but this, combined with imported Egyptian, will not make up for the deficiency due to the shortage of Sea Island cotton. A fair amount of this cotton has been marketed and the demand, although somewhat restricted, continues to take care of the output of all grades. Prices have held steadily around 68 and 70 cents for the best grades.

SEA ISLAND COTTON. Sea Island cotton conditions show no change, with an exceedingly small crop in prospect. The government estimate of 15,000 bales will probably be reduced at the end of the year. Good grades are demanding very high prices. Probably a good grade of average extra choice could be bought for 70 cents.

TIRE FABRICS. The market is very strong. Increased production of tires and the condition of the cotton crop, with the increased shortage in long staple, make it impossible for the mills to meet the demand. The product is sold substantially to the end of 1920.

OTHER FABRICS. A like excess of demand over supply prevails with other cotton fabrics. For waterproofing materials, for sheetings, for hose and belting, for drills and ducks it is the same story of goods very scarce and deliveries for next year only. Asbestos cloth and yarns are hard to get; there are almost no imports from England and none from Germany.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

COMMON with other important industries the rubber trade is suffering from the abnormal freight and labor conditions prevalent. In New York movement of all water-borne freight has been stopped for weeks. These conditions have stimulated demand for spot stocks and raised prices. In some lines production is very much over sold and deliveries postponed. **ANILINE OIL.** Almost impossible to obtain at present from spot stock. Futures are booked so far that manufacturers cannot name a price or promise deliveries a month or six weeks ahead.

BARITES. Stocks very low owing to shipments being tied up by harbor strikes.

Benzol. Spot stock at great premium, because supply in quantities is practically off the market on account of the steel strikes.

GUMS AND RESINS. In great demand with supply very short.

MACKENZIE, HEAVY CEMENT. Stocks short, manufacturers oversold and in some cases closed down because raw supplies cannot be obtained owing to freight and labor troubles.

SULPHUR. General advance in all grades since October 1.

WHITINGS. Held at a premium because stocks are very low as shipments are tied up by the longshoremen's strike.

EMERGENCY MARKET BULLETIN

Published by THE INDIA RUBBER PUBLISHING CO., No. 25 West 45th Street, New York

DECEMBER 1, 1919

ANNOUNCEMENT

THE printers' strike is over. For eight weeks the radical element in the "Big Six" typographical union, in Pressmen's Union No. 51 and Franklin Union No. 23, has ruled. The majority, however, were secretly opposed to radicalism and favored obedience to the parent body, the International Typographical Union, that had promptly discountenanced the strike as contravening existing agreements. But the secessionists broke these agreements, outgeneraled their opponents and refused to obey their superior officers.

The New York publishers and employing printers stood solidly together in the determination that radicalism must be effectively eliminated for all time from the printing industry of New York City. All faced severe financial loss and the danger of losing valuable prestige, yet they were confident that ultimately Americanism would win, and it did.

Following a mandate of the executives of the International Typographical Union that threatened their charter, the conservatives gained strength and outnumbering their opponents, voted to return to work.

In the meantime the November number of THE INDIA RUBBER WORLD has been delayed, but it is now being printed and will be mailed as soon as possible after December 1. The December number is ready for the printer and will closely follow the publication of the November issue.

REVIEW OF THE CRUDE RUBBER MARKET. NEW YORK.

THE CRUDE RUBBER MARKET during the past month has been largely speculative, trading has been active, and there have been large offerings which were taken up as they came, but manufacturers were not as ready to buy as they were the month before. The market has run up to 54½ cents for smoked sheets and has been as low as 52, but the prices for the beginning and the end of the month are practically the same; they have been affected somewhat by the drop in exchange. There is some interest in January-June arrivals.

Those in a position to know are skeptical about British estimates of largely increased production of plantation rubber for 1920 and 1921 and expect rather a falling off from the figures for 1919. It is rumored that the planters in the Far East are going to take concerted action to improve their property by tapping the trees only in alternate years.

Prices for plantation and South American rubber at the beginning and toward the close of the month are shown in the following quotations: PLANTATION *Hevea*. NOVEMBER 1, first latex crepe, spot 54 cents, November-December 53½ cents, January-March 53½-54 cents, January-June 53½ cents, July-December, 1920, 53½-54 cents. NOVEMBER 20, spot 53 cents, futures 53½ cents.

NOVEMBER 1, ribbed smoked sheets, spot 53 cents, November-December 52½ cents, January-March 53 cents, January-June 52½-53 cents, July-December, 1920, 52½-53 cents. NOVEMBER 20, spot 52 cents, futures 52½ cents, July-December, 1920, 52½ cents.

NOVEMBER 1, No. 1 amber crepe, spot 51 cents, futures 50 cents. NOVEMBER 20, spot 50½ cents.

NOVEMBER 1, clear thin brown crepe, spot 46-47 cents, January-June 47-48 cents. NOVEMBER 20, spot 48 cents.

NOVEMBER 1, No. 1 roll brown crepe, spot 40-41 cents, futures 39-41 cents. NOVEMBER 20, spot 47½ cents, futures 41 cents.

SOUTH AMERICAN *PARAS* AND *CAUCHO*. NOVEMBER 1, spot prices: upriver fine 52½-53½ cents, islands fine 49-50 cents, upriver coarse 34-35 cents, islands coarse 22-25 cents, Cameté coarse 22-23 cents, cacho ball 34½-35 cents. NOVEMBER 20, spot prices: upriver fine 52 cents, islands fine 48 cents, upriver coarse 34½ cents, islands coarse 22-23 cents, Cameté coarse 24-25 cents, cacho ball 35 cents.
